Radiation therapy

External beam therapy (teletherapy) components

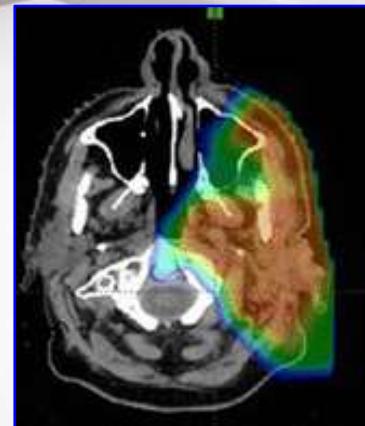

3. Gantry

Rotates beam around patient

4. Beam delivery system

Forms the treatment field

5. Treatment planning

Calculates dose in patient and required beam parameters

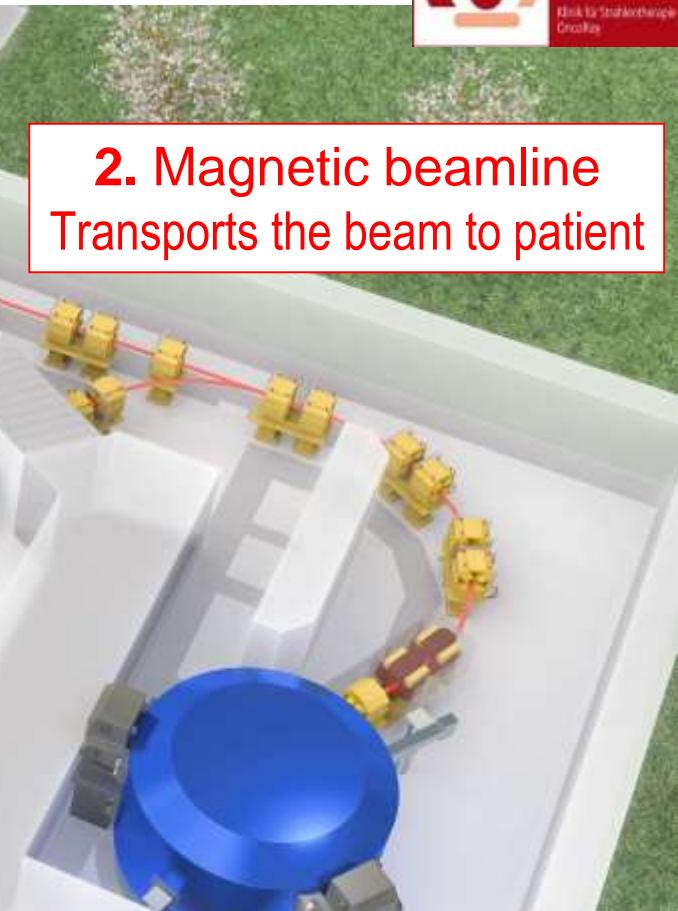

6. Dosimetry

Measures beam and ensures correct dose delivery

2. Magnetic beamline

Transports the beam to patient

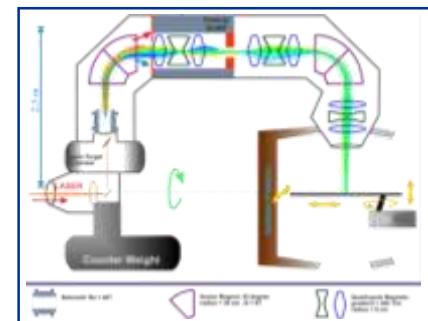

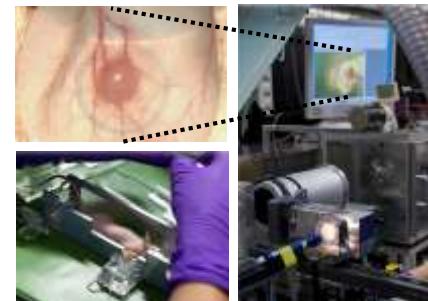

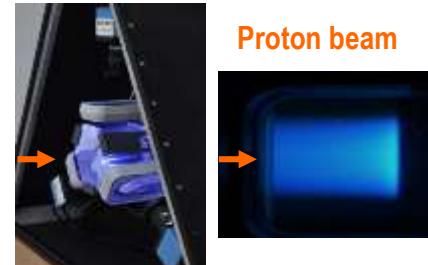

1. Accelerator

Produces the beam

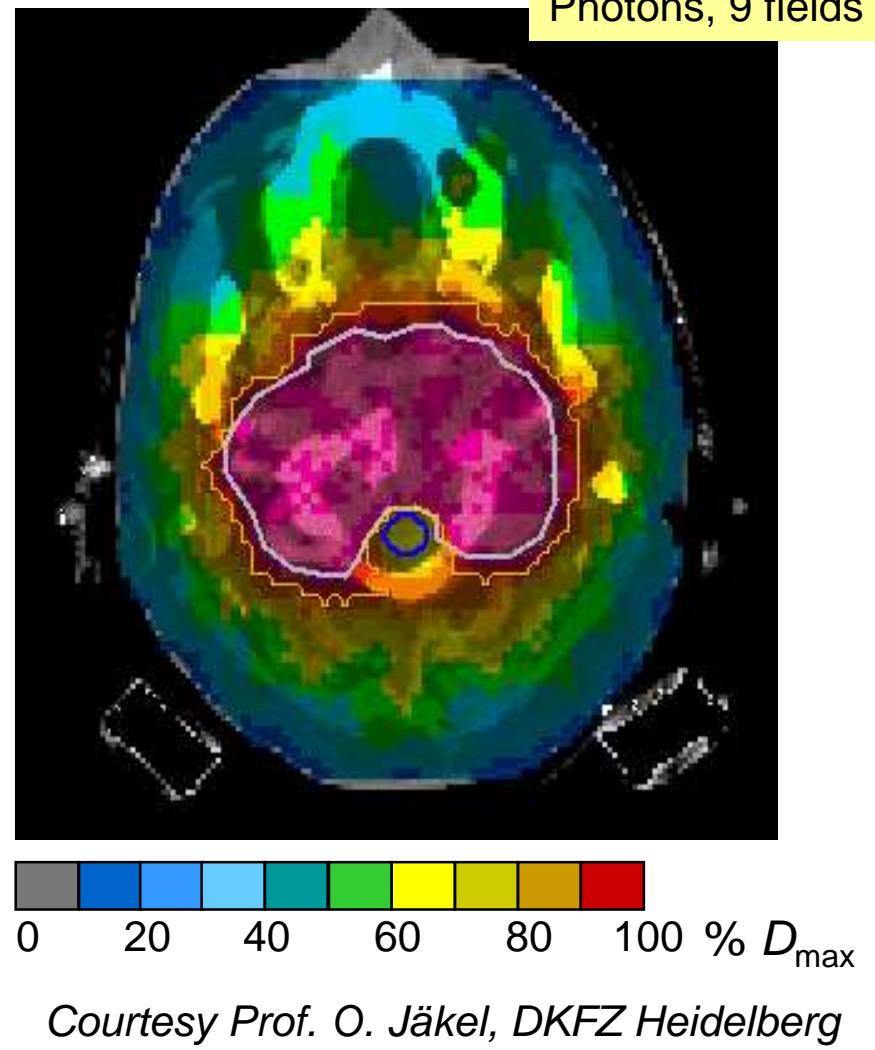

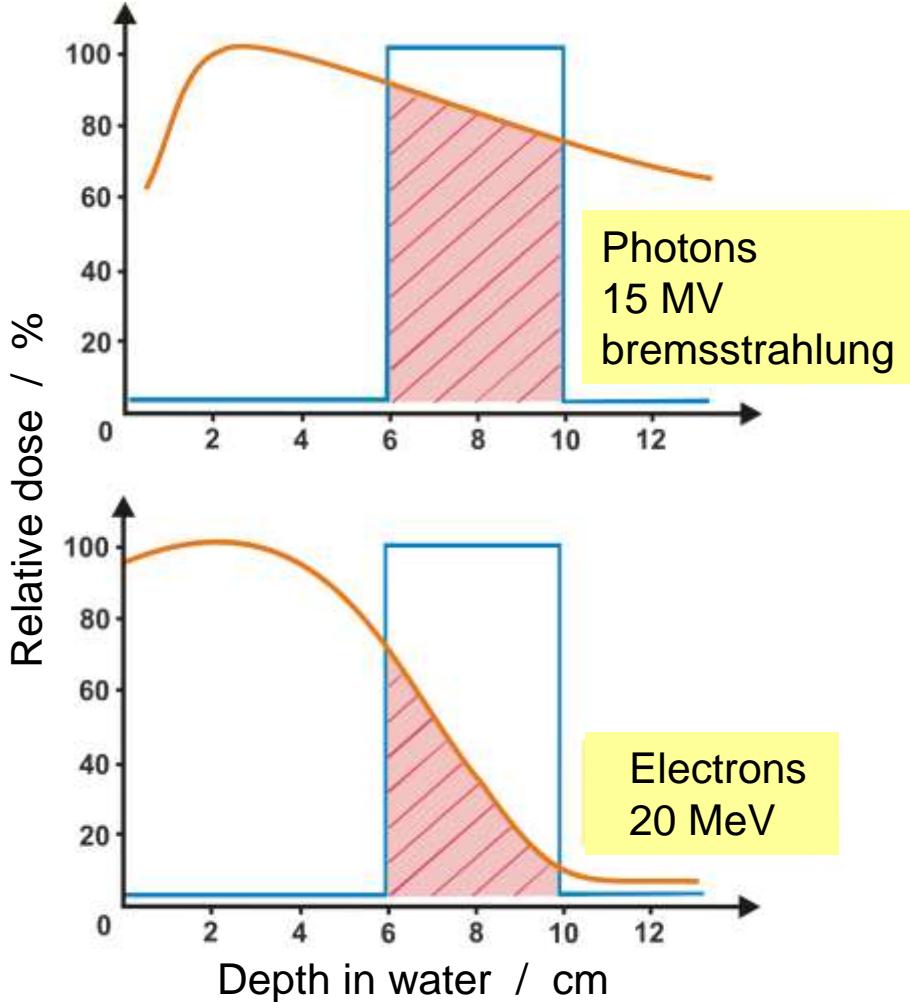

Outline

1. Motivation
2. Laser particle acceleration
3. Research project onCOOPTics
4. Cell and small animal irradiation
5. Towards preclinical prototype
6. Summary

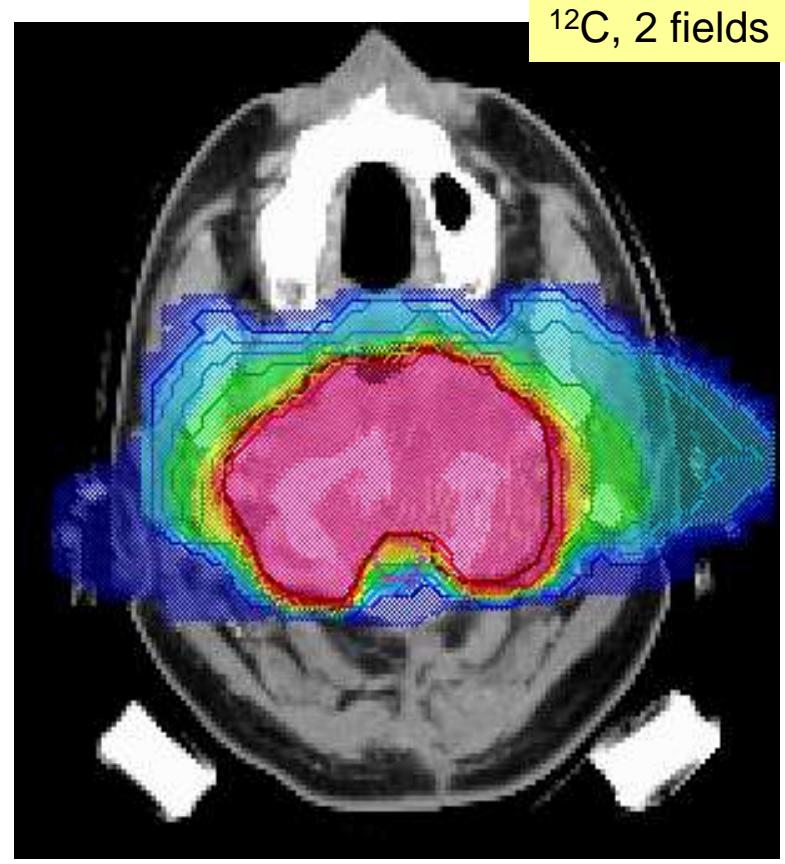

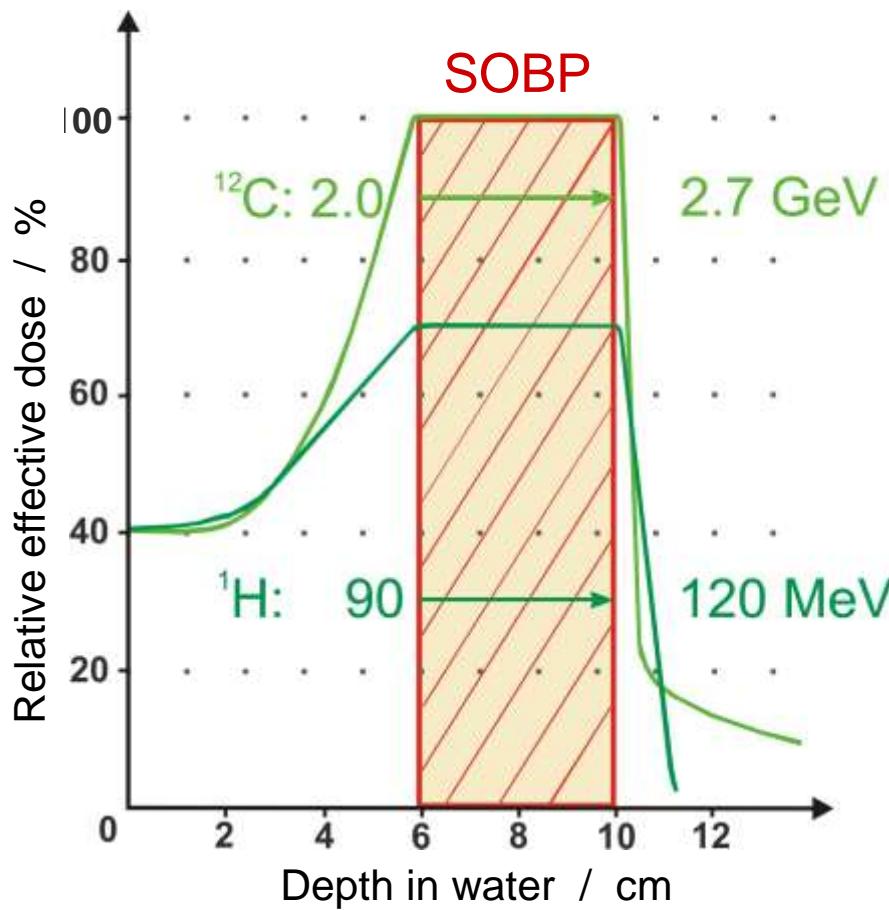

1. Motivation

“Conventional” therapy radiation

1. Motivation

Heavy charged particles
(Ions: ^1H ... ^{12}C ... ^{20}Ne)

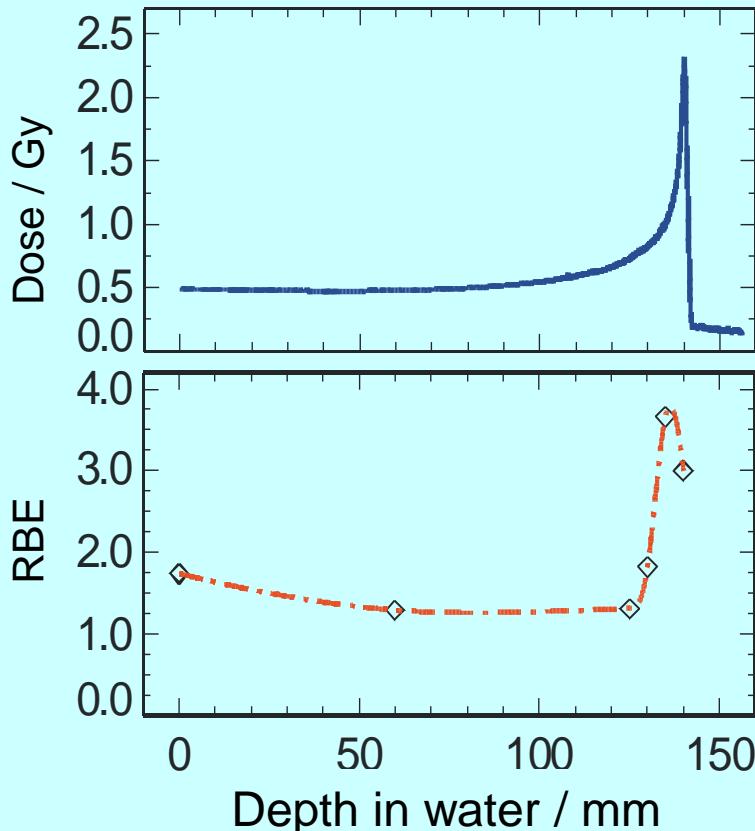

Courtesy Prof. O. Jäkel, DKFZ Heidelberg

1. Motivation

Heavy charged particles (Ions: ^1H ... ^{12}C ... ^{20}Ne)

^{12}C : $E = 270 \text{ AMeV}$, Target: water

Courtesy W. Kraft-Weyrather, GSI Darmstadt

Advantages of ion beams versus „conventional“ therapy radiation species (electrons and photons):

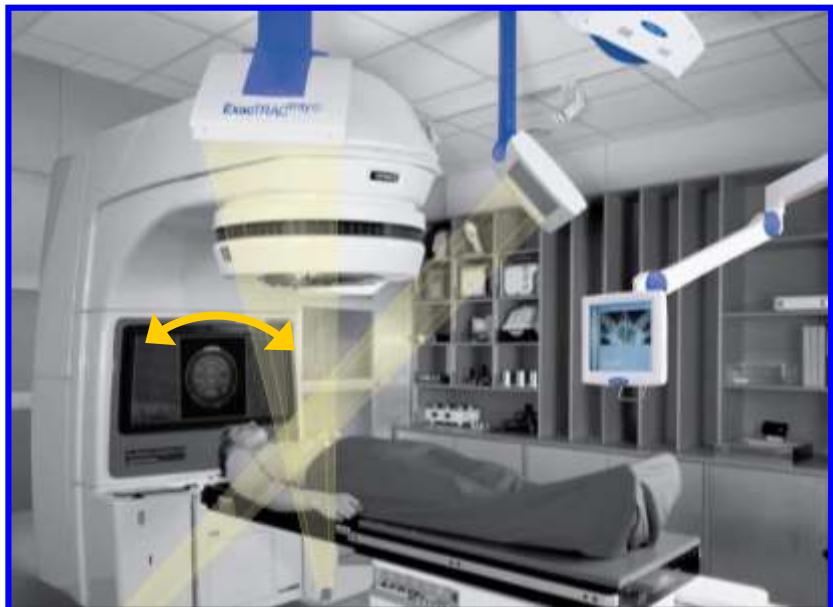

- ➊ Well defined range by beam energy
- ➋ Dose growing with depth until the maximum particle range (“inverted depth dose distribution”)
- ➌ Elevated RBE in the Bragg-maximum for ions with $Z > 2$

Indications for ion therapy:

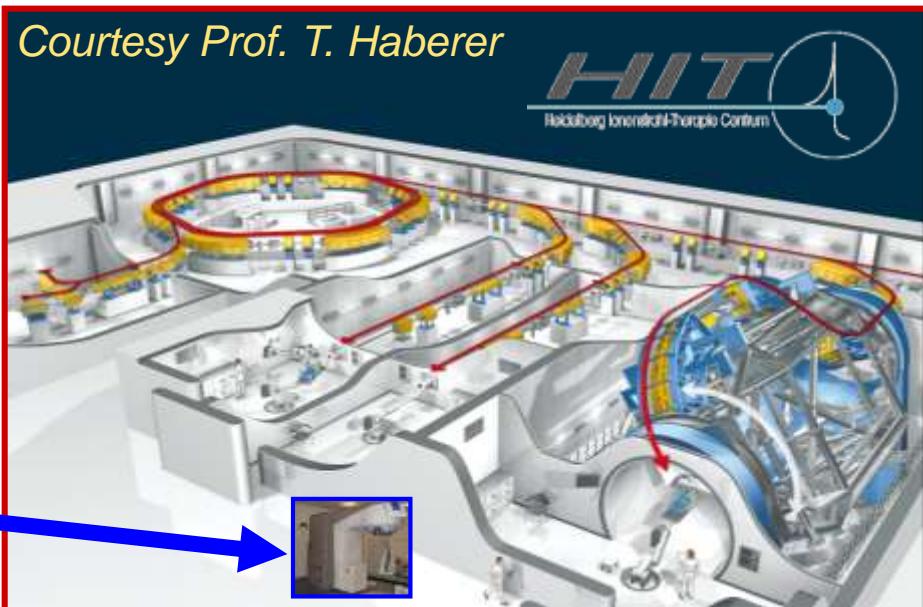

- ➊ Compact, deep-seated and radiation resistant tumors
- ➋ In the vicinity of organs at risk

1. Motivation

Electron LINAC
(20 MeV e^- , 20 MV photons)

Ion Beam Therapy Facility
(430 MeV/Nucleon ^{12}C , synchrotron)

Components: source, accelerator, beamline, gantry

~ 10 Mill. €
~ 550 only Germany

Investment costs
Number of installations

~ 100 Mill. €
~50 worldwide

1. Motivation

Electron LINAC (20 MeV e^- , 20 MV photons)

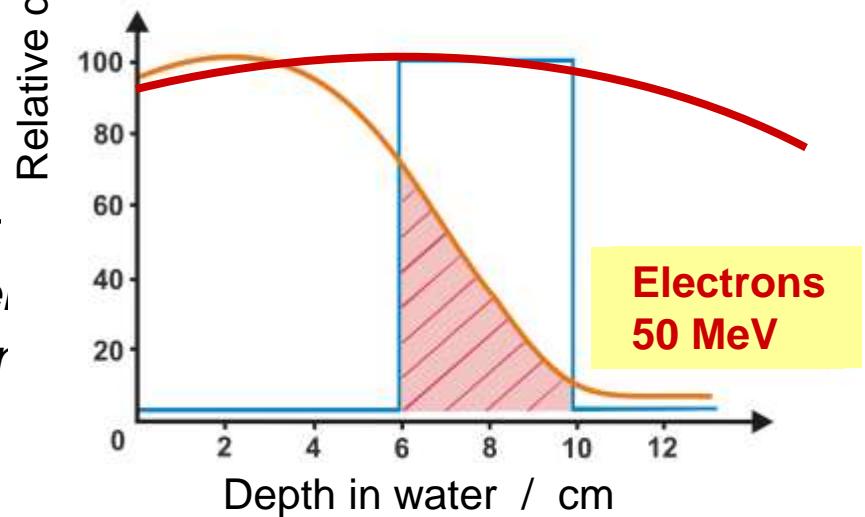

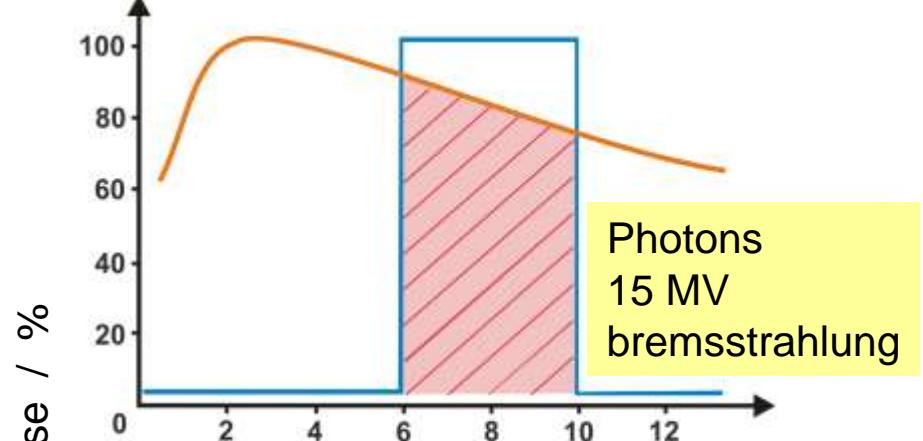

Components: source, accelerator
~ 10 Mill. €
~ 550 only Germany

Investment
Number of institutions

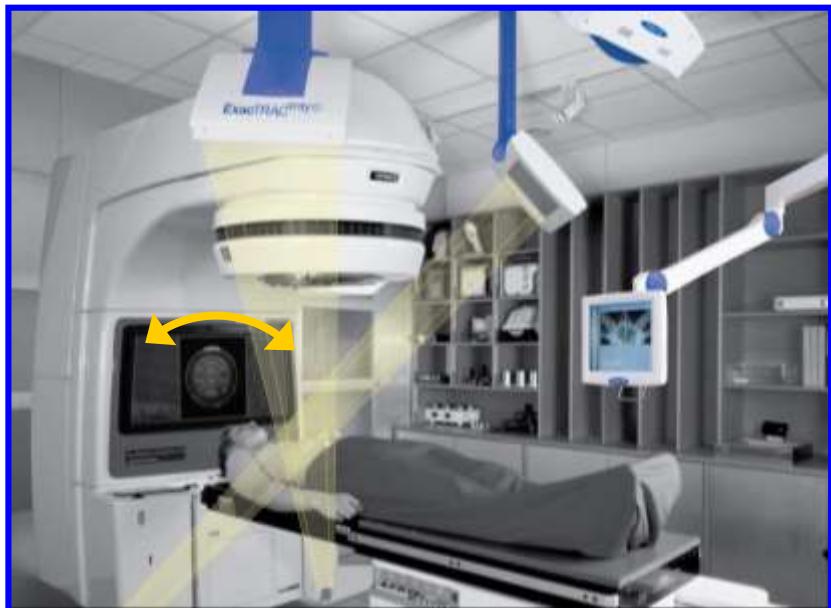

⇒ Improve dose by very high energy electrons (~ 100 MeV)

“Conventional” therapy radiation

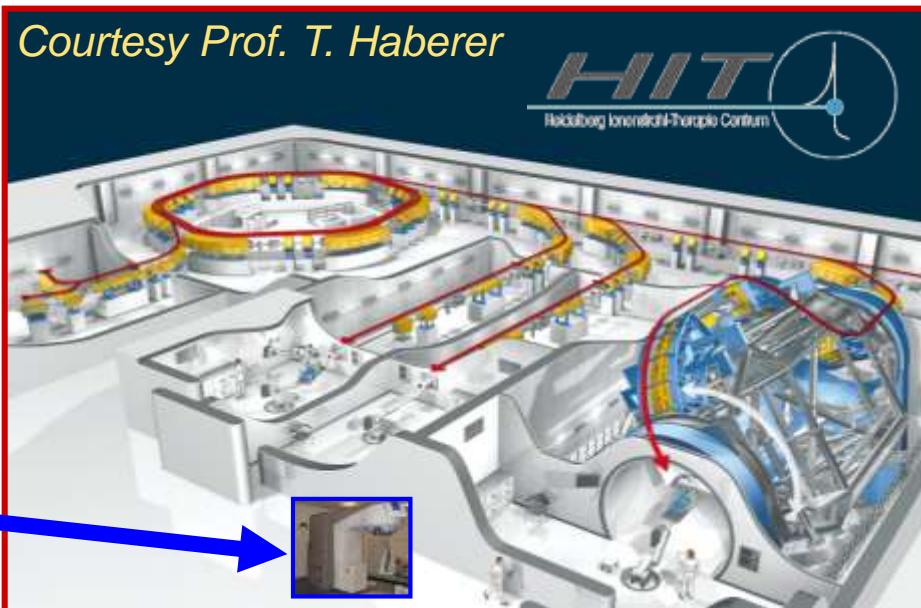

1. Motivation

Electron LINAC
(20 MeV e^- , 20 MV photons)

Ion Beam Therapy Facility
(430 MeV/Nucleon ^{12}C , synchrotron)

Components: source, accelerator, beamline, gantry

~ 10 Mill. €

~ 550 only Germany

Investment costs

Number of installations

~50 worldwide

⇒ Improve dose by very high energy electrons (~ 100 MeV)

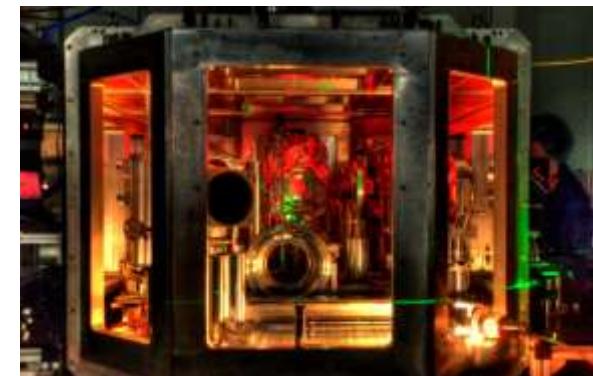

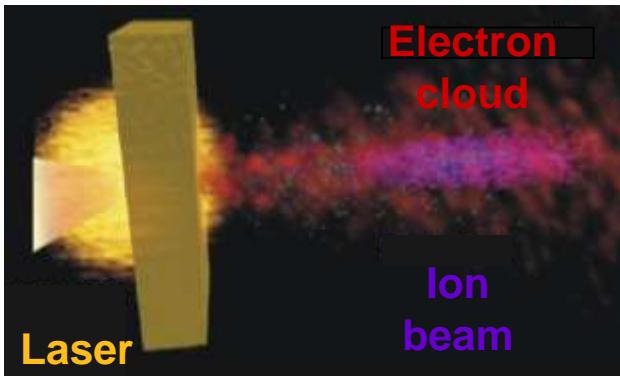

⇒ More compact and cost effective facilities

1. Motivation

Main focus on: **Development of
compact ion therapy facility
based on high-intensity laser**

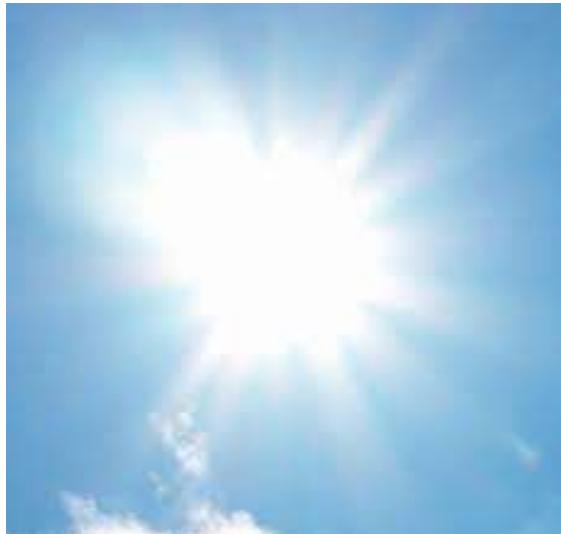

by reducing

- therapy accelerator
- beam transport line and gantry by using
 - ⇒ *optical beamline (mirrors) for laser light*
 - ⇒ *pulsed magnets for particle beam*

2. Laser particle acceleration

- Ingredients: Light and simple foil

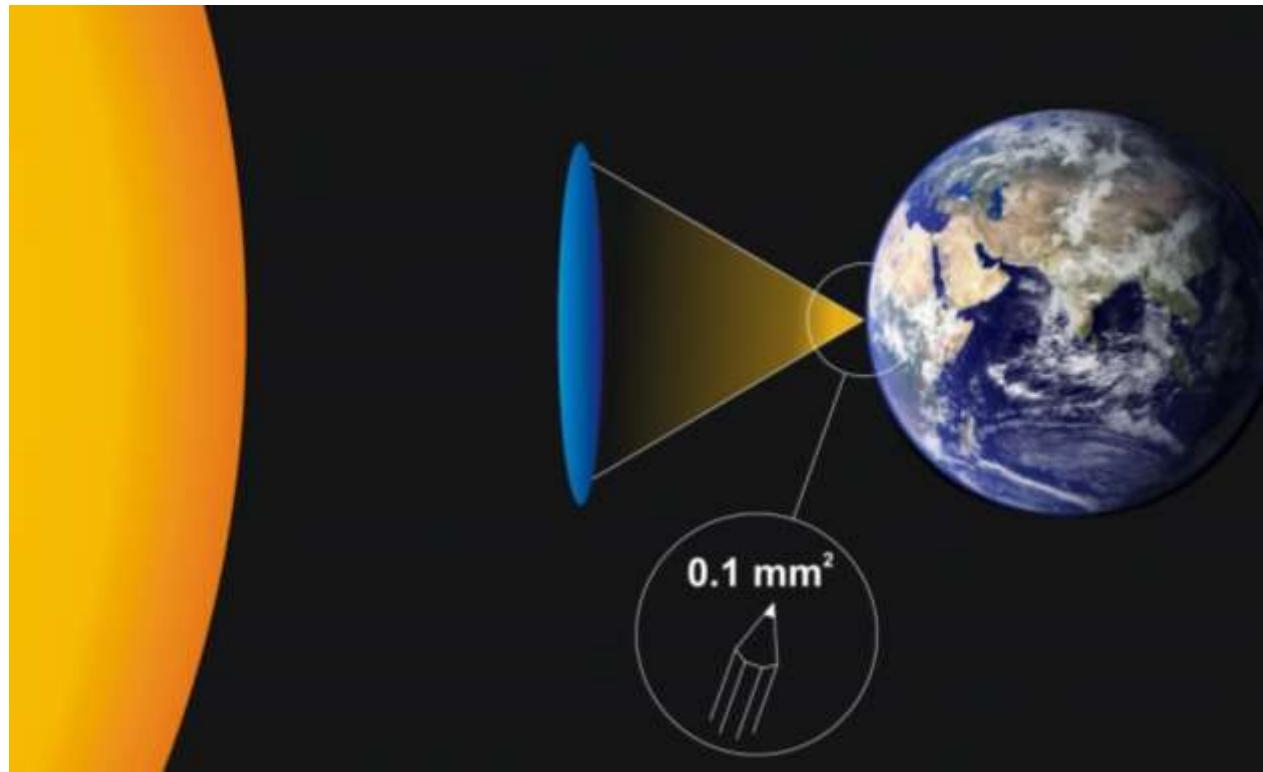

+

2. Laser particle acceleration

- Light of high intensity: $I_{\text{Light}} = 10^{20} \text{ W/cm}^2$

2. Laser particle acceleration

- Solution: High intensity laser

$$I_{\text{Light}} = 10^{20} \text{ W/cm}^2$$

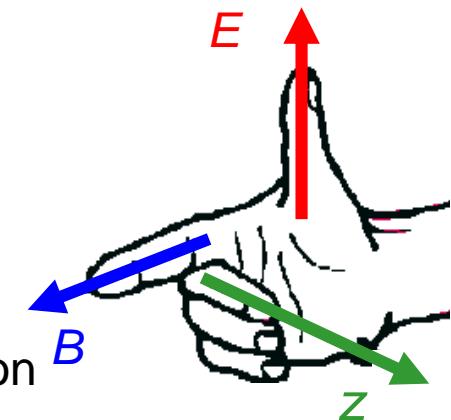

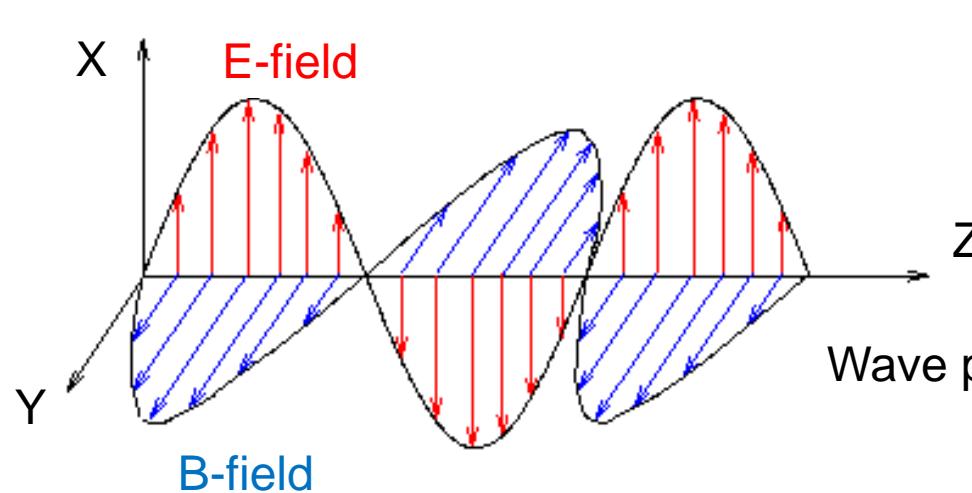

- Focus the laser light
 - Very high laser power
 - Moderate laser energy, but ultra-short pulse duration
- $10 \mu\text{m}$ focal spot size
 - 100 TW power
 - 3 J energy
 - 30 fs pulse duration

Power: $1 \text{ PW} = 1000 \text{ TW}$ ($1 \text{ TW} = 10^{12} \text{ W}$), Pulse duration: $1 \text{ fs} = 10^{-15} \text{ s}$

2. Laser particle acceleration

- Light is an electromagnetic wave: $\vec{F}_L = e(\vec{E} + \vec{v} \times \vec{B})$

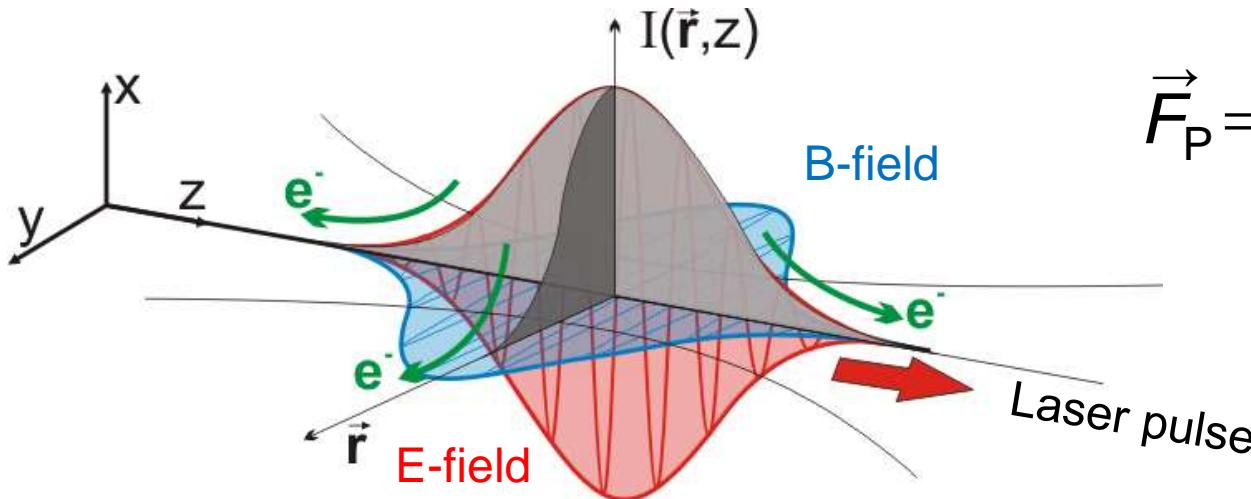

- Low light intensity: Coulomb component dominates
- Higher intensity: Electron acceleration and contribution by magnetic component
- $I_{\text{Light}} \sim 10^{18} \text{ W/cm}^2$: Electron already reach relativistic energy ($v_e \sim c$) within half a laser period

Light pulse: wave length $\sim 850 \text{ nm}$ \rightarrow frequency $\sim 0.3 \cdot 10^{15} \text{ Hz}$ (= 300 THz)

2. Laser particle acceleration

- Ponderomotive acceleration by intensity gradient:

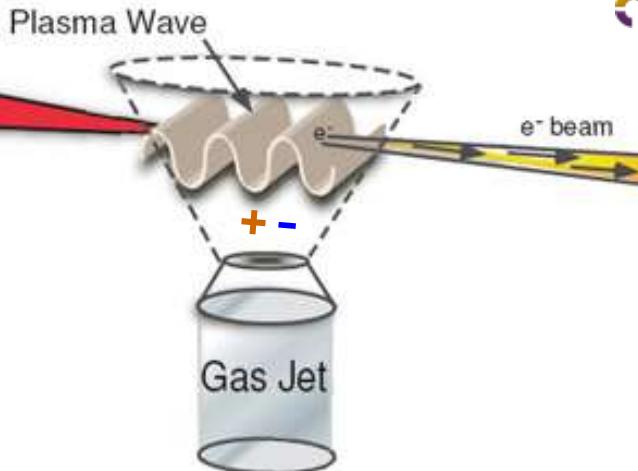

$$\vec{F}_P = -\frac{e^2}{4m\omega^2} \nabla E^2$$

- $I_{\text{Light}} \sim 10^{24} \text{ W/cm}^2$ for direct proton acceleration ($m_p = 1000 \cdot m_e$)

⇒ **For acceleration of a beam pulse (very many particles), collective effect is necessary!**

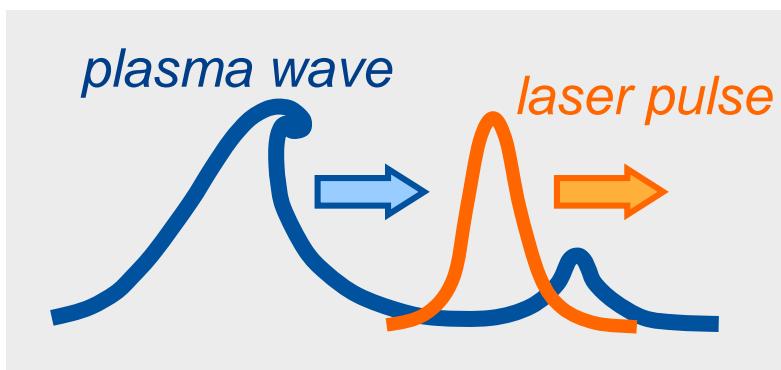

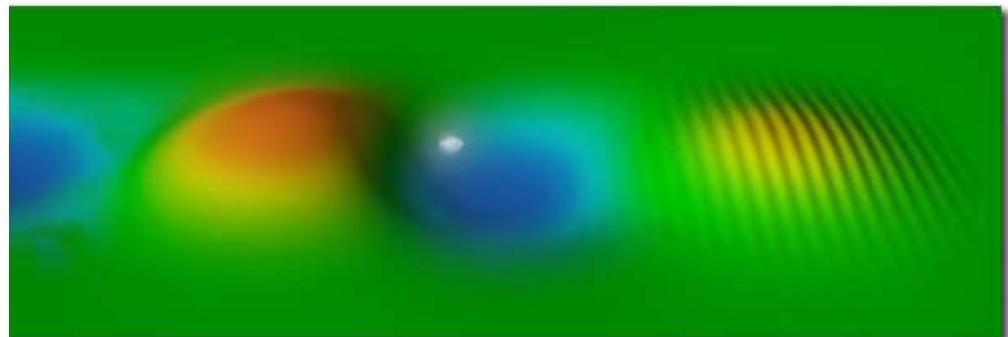

Light pulse: duration $\sim 30 \text{ fs}$ → length $\sim 9 \text{ mm}$

2. Laser electron acceleration

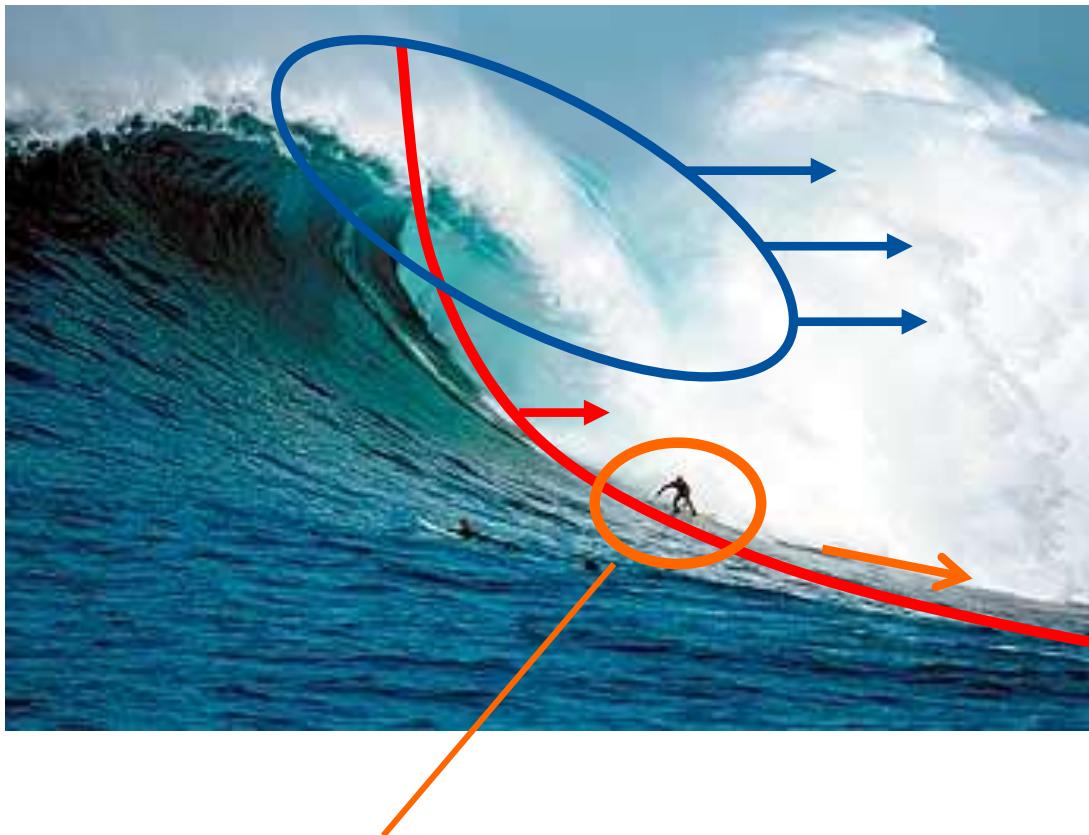

Laser wakefield acceleration (LWFA):

- Laser pulse generates an electron density modulation: plasma wave
- Support gradients of **GeV/cm** for $5 \times 10^{18} \text{ e/cm}^3$

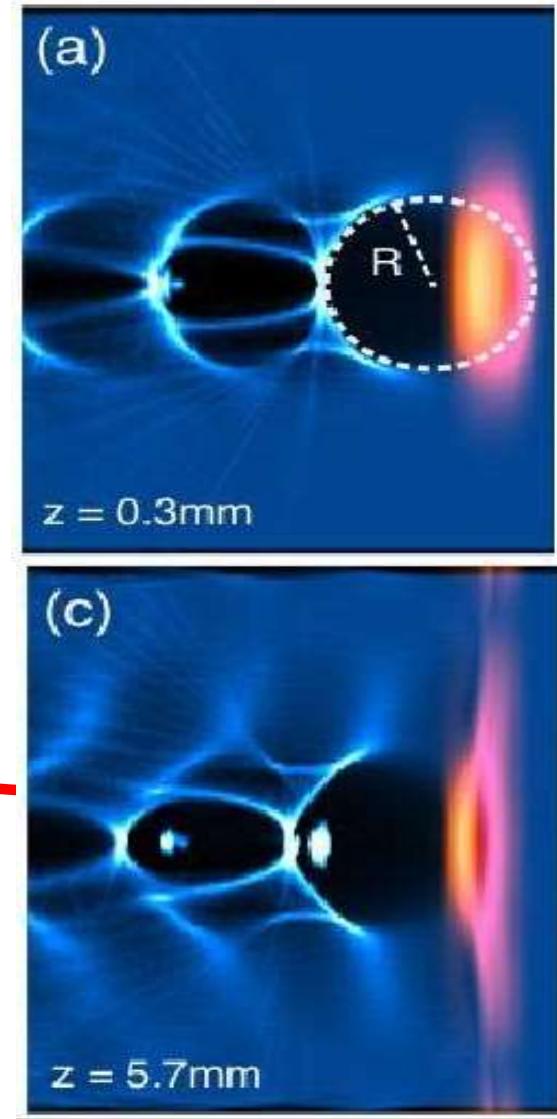

2. Laser electron acceleration

- Non-linear wave-breaking (self-injection) $v > v_{ph}$

- Test particle (external injection) $v_e > v_{ph}$

2. Laser electron acceleration

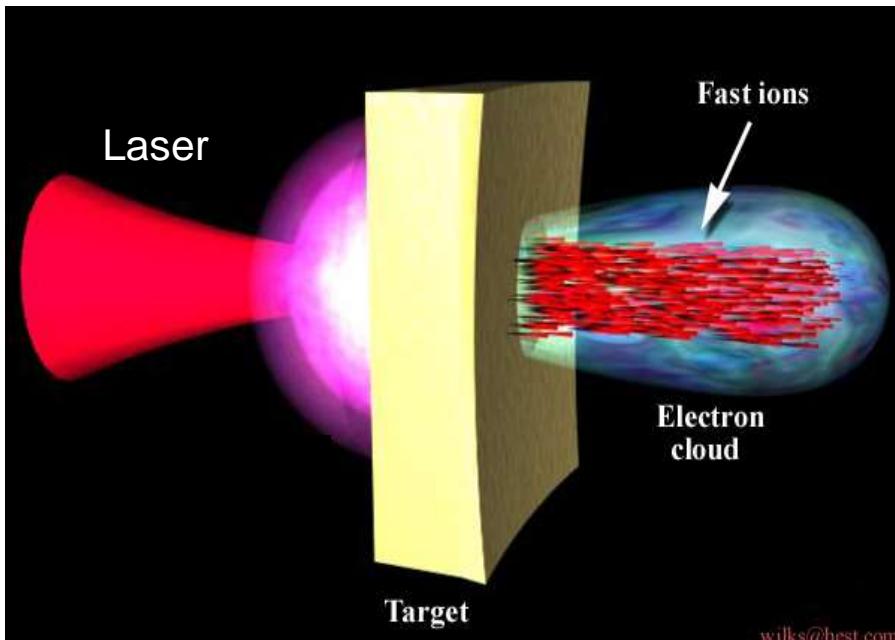

... effective, but rather hard to control

and normally destructing the accelerating wave (or wake)

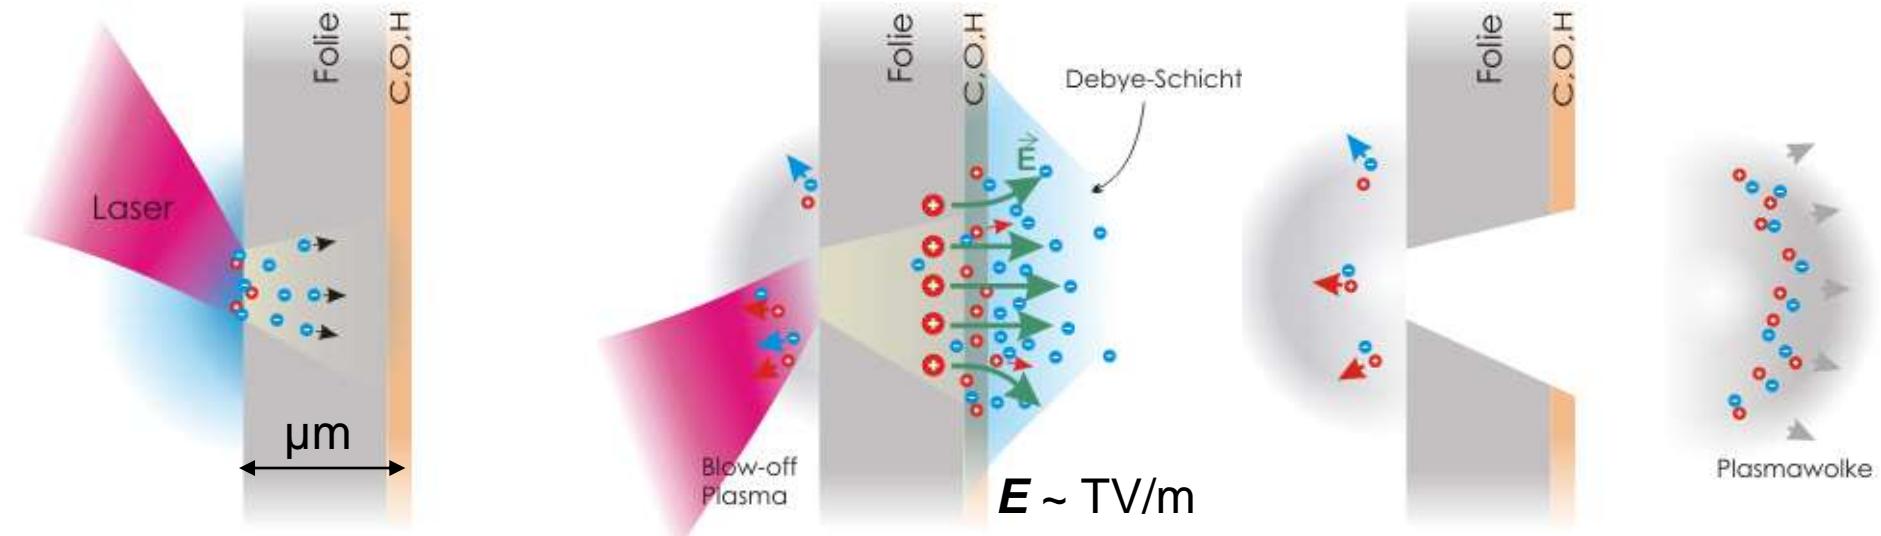

2. Laser ion acceleration

- ↳ Ions too heavy for direct acceleration
 - ⇒ *quasi-static fields required*
 - ⇒ *overdense plasmas (solid density, opaque)*

2. Laser ion acceleration

Target Normal Sheath Acceleration (TNSA)

The laser light:

- is absorbed and creates a plasma in the foil
 - accelerates electrons
- fs - time scale**

The electrons:

- propagate through the foil and form Debye sheath
- build up a quasi-static electric field

The electric field:

- ionizes the rear surface and accelerates the ions
 - expander plasma into vacuum
- ps - time scale**

2. Laser particle acceleration

Laser target:

$$I_{\text{Light}} \geq 10^{18} \text{ W/cm}^2$$

Interaction with matter

Gas (high density)

transparent

Solid (foil)

opaque

LWFA

TNSA

**Electron
acceleration**

**Ion
acceleration**

$$m_{\text{Electron}} \ll m_{\text{Ion}}$$

2. Laser particle acceleration

Laser system characteristics:

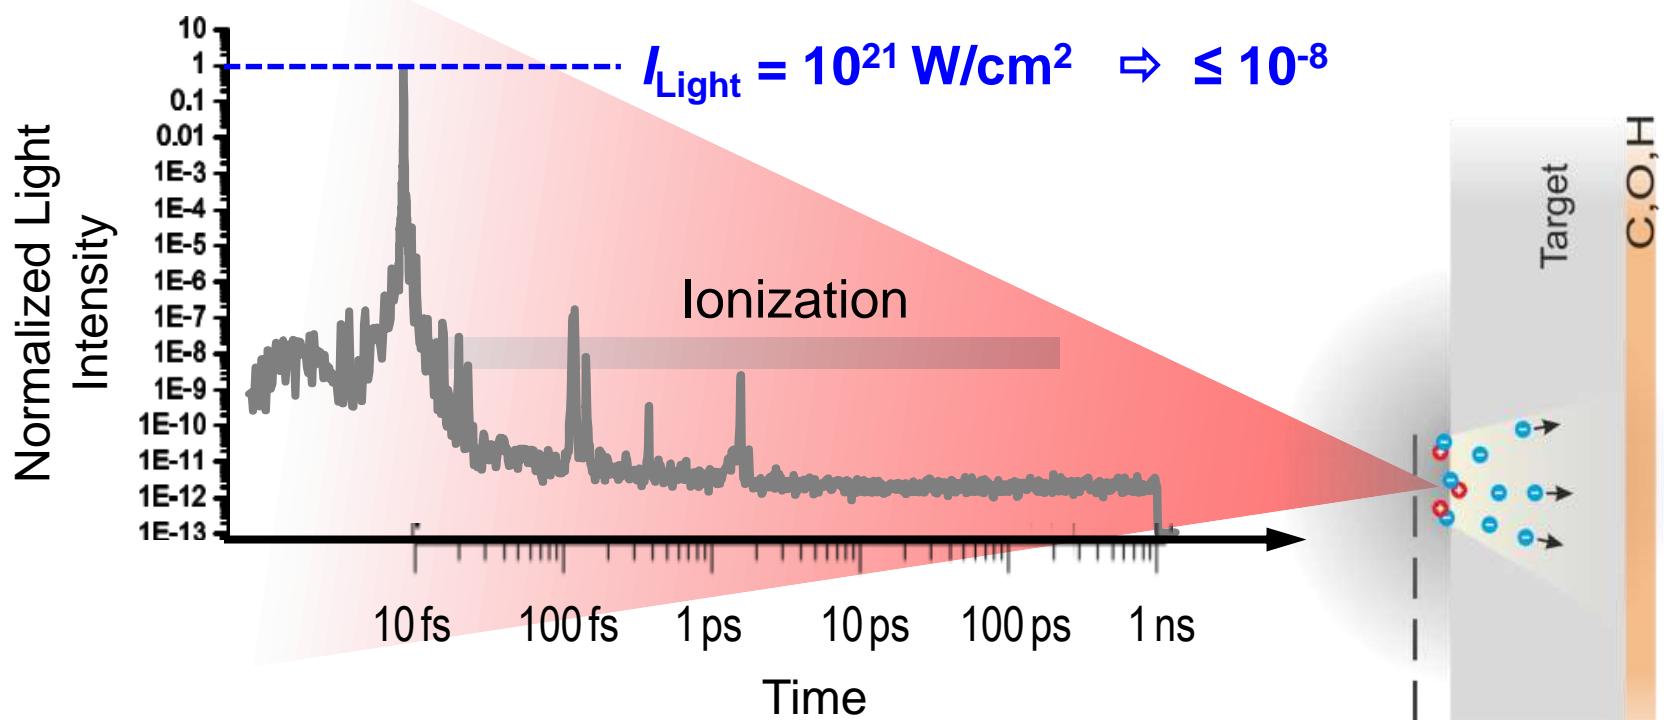

- ◉ Pulse duration
 - ultra-short pulse ($\sim 1 \text{ fs} \dots \sim 100 \text{ fs}$)
 - short pulse ($\sim 100 \text{ fs} \dots \sim \text{ps}$)
 - long pulse ($\sim \text{ns}$)
- ◉ Energy per pulse (laser peak power)
 - $\sim \text{J}$ ($\sim \text{Terawatt}$)
 - $\sim \text{kJ} \dots \sim \text{MJ}$ ($\sim 1 \text{ Petawatt}$)
- ◉ Pulse repetition rate
 - $> \text{Hz}$
 - few shots per day / hour
- ◉ Temporal pulse contrast
 - $\leq 10^{-6}$ (ionization threshold: 10^{13} W/cm^2 , no preplasma)

*Amplifier chain of the SHIVA laser at LLNL,
late 1970's
(Nd:Glass 10 kJ, 1 ns)*

2. Laser particle acceleration

Laser system characteristics:

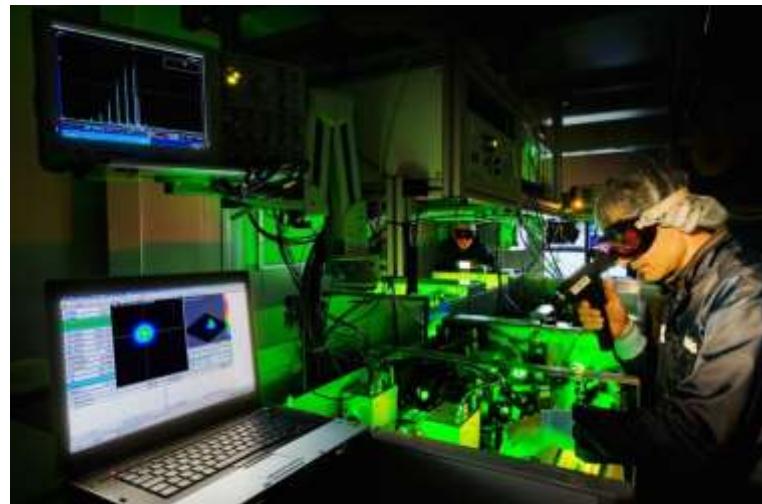

Temporal pulse contrast

- $\leq 10^{-6}$ (ionization threshold: 10^{13} W/cm^2 , no preplasma)

2. Laser particle acceleration

Laser system for electron therapy:

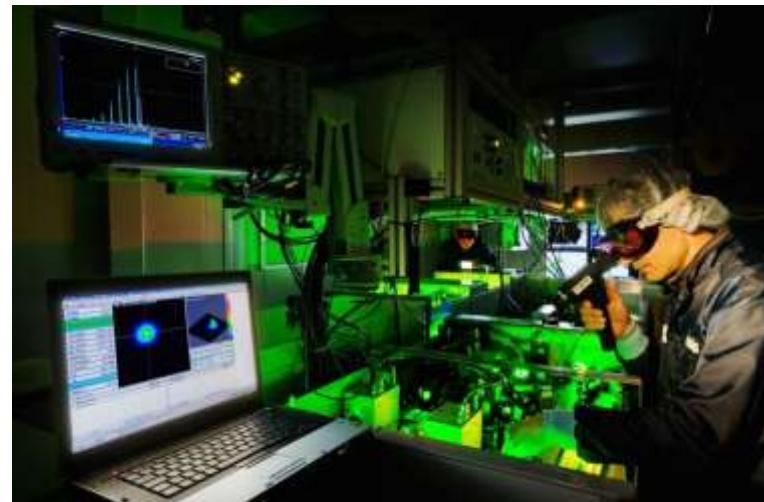

- ◉ Pulse duration
 - **ultra-short pulse (~ 1 fs ... ~ 100 fs)**
 - short pulse (~ 100 fs ... ~ ps)
 - long pulse (~ ns)
- ◉ Energy per pulse (laser peak power)
 - **~ J (~ 10 Terawatt)**
 - ~ kJ ... ~ MJ (~ 1 Petawatt)
- ◉ Pulse repetition rate
 - **> Hz**
 - few shots per day / hour
- ◉ Temporal pulse contrast
 - **~ 10^{-6}** (ionization threshold: $10^{12...13} \text{ W/cm}^2$, no preplasma)

2. Laser particle acceleration

Laser system for ion therapy:

- ◉ Pulse duration
 - ultra-short pulse ($\sim 1 \text{ fs} \dots \sim 100 \text{ fs}$)
 - **short pulse ($\sim 100 \text{ fs} \dots \sim \text{ps}$)**
 - long pulse ($\sim \text{ns}$)
- ◉ Energy per pulse (laser peak power)
 - $\sim \text{J}$ ($\sim \text{Terawatt}$)
 - **$\sim \text{kJ} \dots \sim \text{MJ} (\sim 1 \text{ Petawatt})$**
- ◉ Pulse repetition rate
 - **> Hz**
 - few shots per day / hour
- ◉ Temporal pulse contrast
 - **$\leq 10^{-8}$** (ionization threshold: $10^{12\dots 13} \text{ W/cm}^2$, no preplasma)

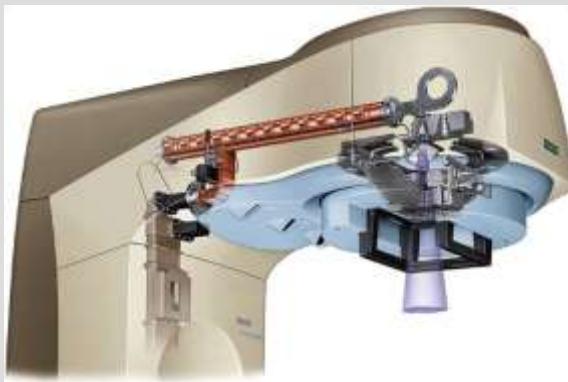

2. Laser particle acceleration

Conventional therapy accelerators:

Electron LINAC

20 MeV e^-

Proton Cyclotron

230 MeV p

Carbon Synchrotron

430 MeV/Nucleon ^{12}C

20 MV/m

1 MV/m

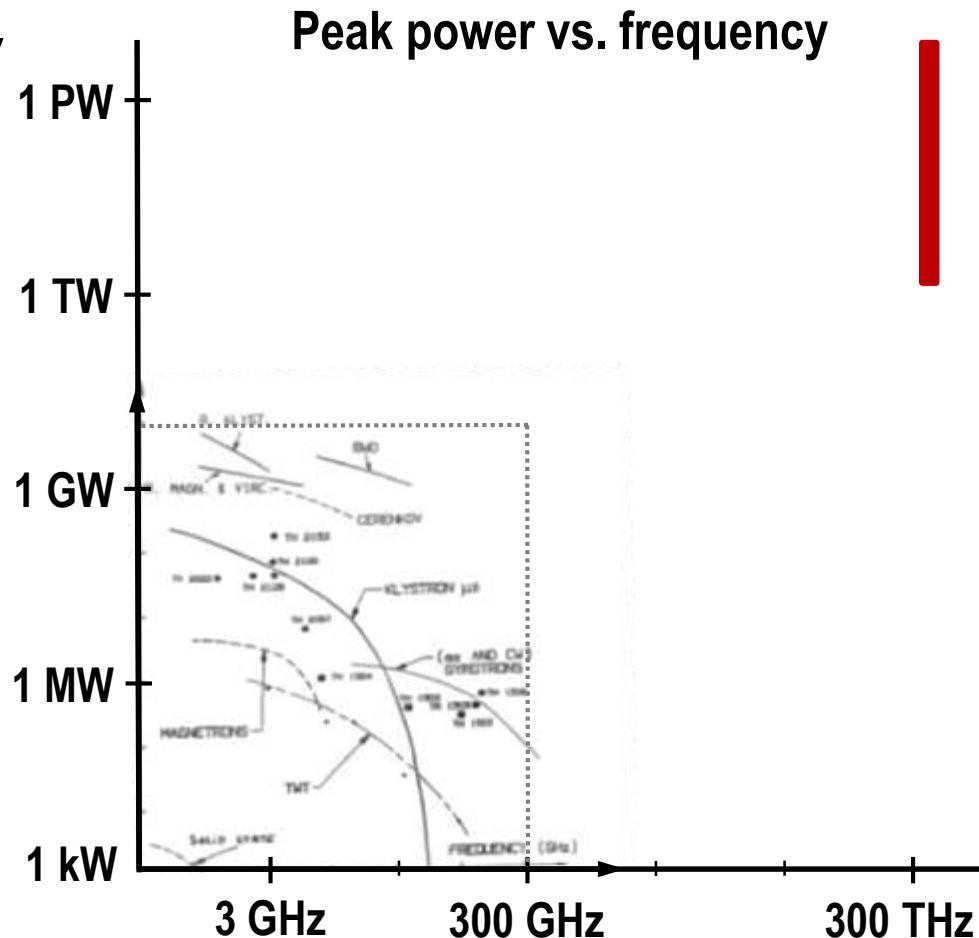

0,01 MV/m

**Laser Particle Accelerator: 1.000.000 MV/m
(\Rightarrow 1000 MeV at 1 mm)**

2. Laser particle acceleration

Rational of light as power source for accelerators:

- Increasing the driver frequency has been key in accelerator development
- Offering large peak power and frequency, **laser pulses** represent the natural extent of this strategy
- Plasma is one promising medium for converting laser energy in **ion kinetic energy over short distance / time**
 - Compactification
 - Particle bunch properties

R.G. Carter: <http://cds.cern.ch/record/865919/files/p107.pdf>

2. Laser particle acceleration

Conventional therapy accelerators:

Electron LINAC

20 MeV e^-

Proton Cyclotron

230 MeV p

Carbon Synchrotron

430 MeV/Nucleon ^{12}C

20 MV/m

1 MV/m

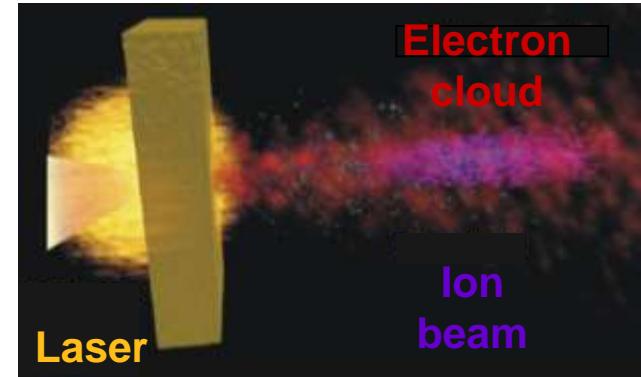

0,01 MV/m

- Deliver monoenergetic, pencil-like, (quasi) continuous particle beams

2. Laser particle acceleration

Specific properties of laser-accelerated particle beams compared to conventional accelerator beams:

- ◉ Ultra-short beam pulses (~ 1 ps)
- ◉ Low pulse repetition rate (~ 10 Hz)
- ◉ High single pulse dose (~ 1 Gy) and ultra-high pulse dose rate (> 10^{12} Gy/s)
- ◉ Broad energy spectrum
- ◉ Large beam divergence (~ 10 degrees)
- ◉ Contaminated beams (e^- , γ , X, other ions, n)
- ◉ Instable beams due to non-linear acceleration process

Medical particle beams

Laser radiooncology

2. Laser particle acceleration

History:

- ◉ 1979: First theoretical description (electrons)
T. Tajima and J.H. Dawson: Laser electron accelerator. Physical Review Letters 43, 267-270
- ◉ 1985: Introduction of chirped pulse amplification (CPA) and generation of high-intensity laser pulses
D. Strickland & G. Mourou: Optics Communications 56 (1985) 219-221
P. Maine et al.: IEEE Journal of Quantum Electronics 24 (1988) 398-403
- ◉ Since 2000:
 - Tremendous progress in experimental generation of intense electron and proton/ion pulses (single-pulse experiments!)
 - Proposal for medical application (based on theoretical study and simulation!)
⇒ **Main focus on laser-driven ion therapy**

2. Laser particle acceleration

History:

- ◉ Since 2005: Establishment of national research network consortia
 - USA: FCCC (**Fox Chase Cancer Center**) ✗
 - Japan: PMRC (**Photo-Medical Research Center**) ✗
 - France: SAPHIR (**SOURCE Accélérée de Protons par laser de Haute Intensité pour la Radiologie**) ✓
 - UK: LIBRA (**Laser Induced Beams of Radiation and their Application**) ✓
 - Germany: MAP (**Munich-centre for Advanced Photonics**) ✓
 - Germany: **onCOOPtics** (**OncoRay + ultra optics**) ✓
 - Italy: PROMETHEUS (**PROtons, ions and coherent x-rays facility based on high power laser for MEdical research, oncological THErapy, bio-imaging and radiobiological USes**) ?
 - Europe (Czech Republic / Hungary): ELI-MED / ELI-ALPS ✓

3. Research project onCOOPtics

Supported by

Bundesministerium
für Bildung
und Forschung

2007-2012, 11.5 Mill. €
(grant no. 03ZIK445)

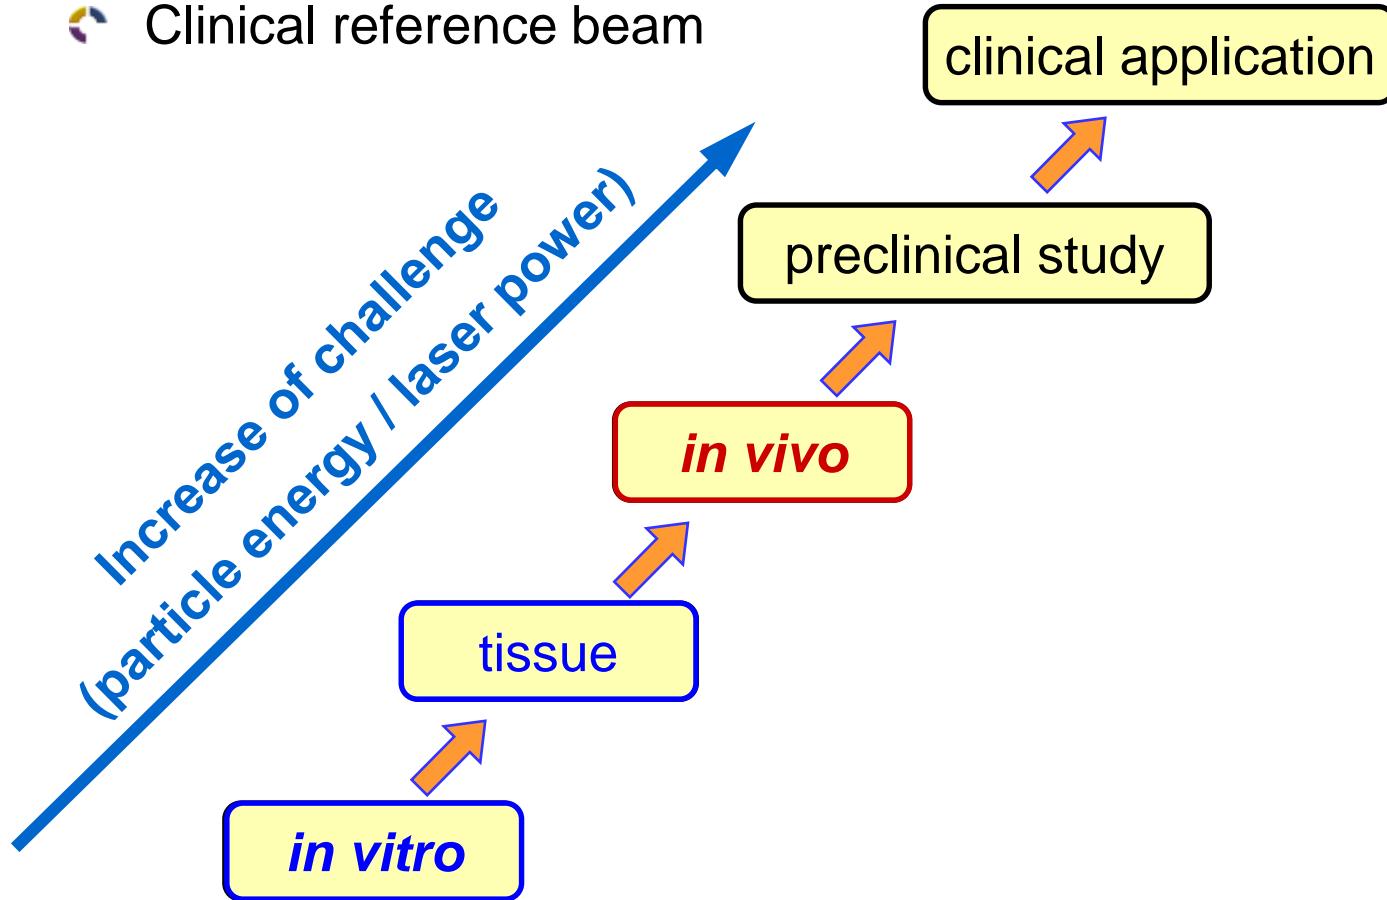

2012-2017, 6.7 Mill. €
(grant no. 03Z1N511)

3. Research project onCOOPtics

Implementation of new technology:

- Translation research
- Clinical reference beam

3. Research project onCOOPtics

Precondition: Sufficiently intense laser system

- ◉ Stable and reliable operation with reproducible beam properties
- ◉ From laser-accelerated electrons ...
... to laser-accelerated proton beams

Available laser systems:

- ◉ 2007: **10 TW laser JETI** (10 Hz, 80 fs, 1 J), Jena
 - **Electron acceleration up to 50 MeV**
 - Proton acceleration up to 2.5 MeV
- ◉ 2010: **150 TW laser DRACO** (10 Hz, 25 fs, 4 J), Dresden
 - Commercial system
(Amplitude Technologies, France)
 - **Proton acceleration up to 25 MeV**

Laser-based irradiation technology:

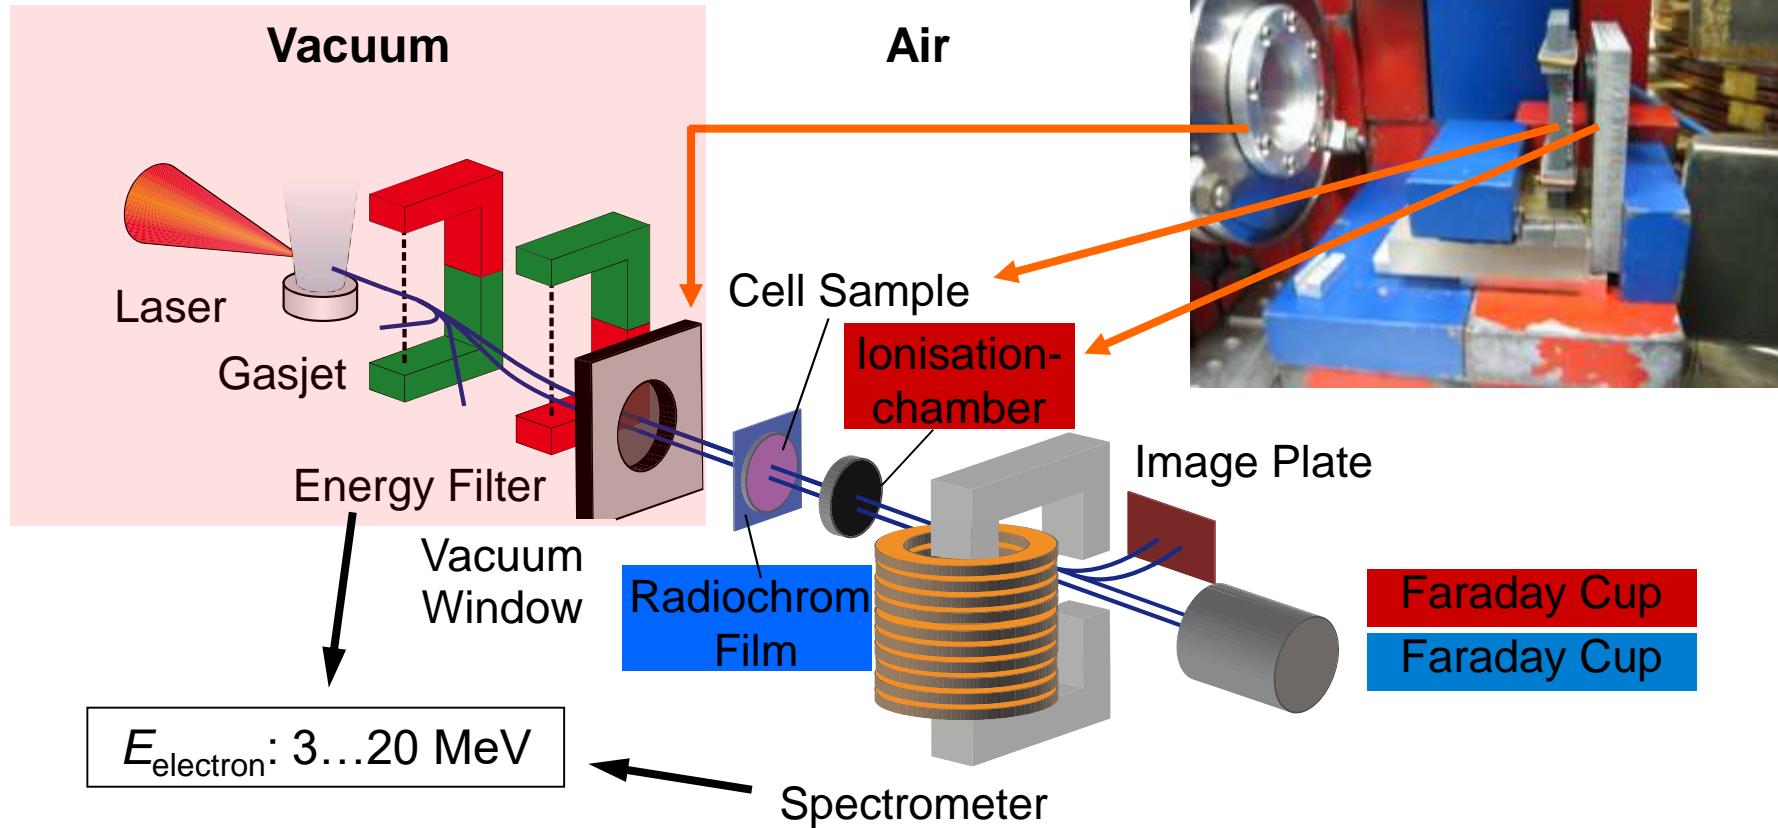

- ◉ Established with all necessary key components like
 - Laser accelerator
 - Precise real-time and absolute dosimetry
 - Suitable irradiation field formation including energy selection
 - Simple treatment planning
 - Controlled delivery of prescribed dose
- ◉ For laser electrons and laser protons
- ◉ Used for systematic radiobiological experiments

Limitation:

- ◉ Irradiation at fixed horizontal beams (no rotating gantry)
- ◉ Dose delivery to small target volumes (~ cm size)
- ◉ Beam transport by conventional (permanent) magnets

4. Cell irradiation

Laser electrons at JETI:

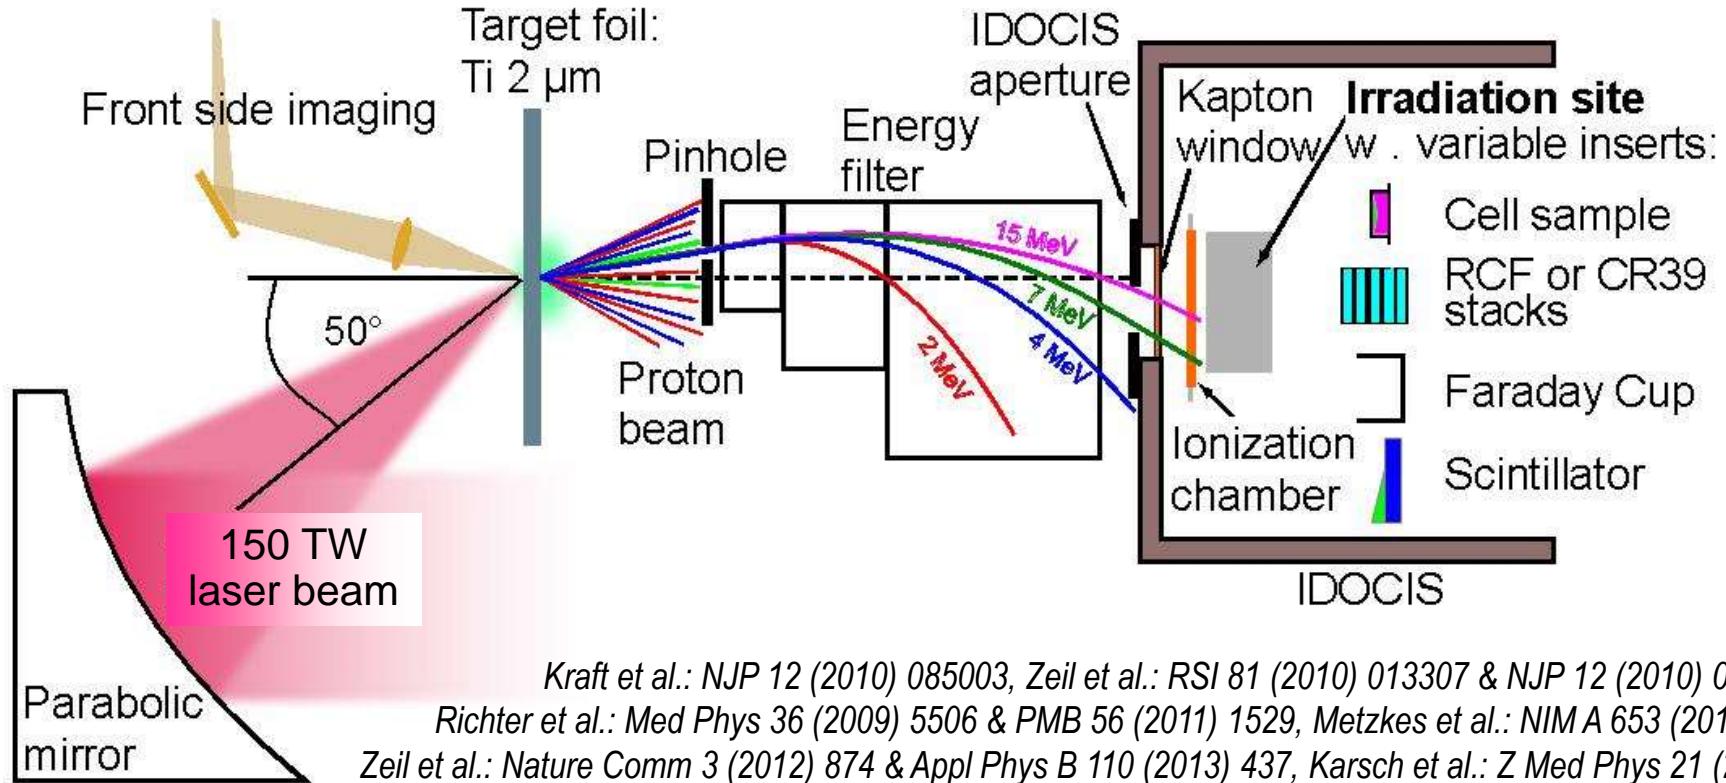

Online dosimeter \Rightarrow Beam monitoring, irradiation control

Offline dosimeter \Rightarrow Absolute dosimetry @ cell monolayer

4. Cell irradiation

Laser protons at DRACO: $E_p = 6\text{-}18 \text{ MeV}$; $f = 0,1 \text{ Hz}$

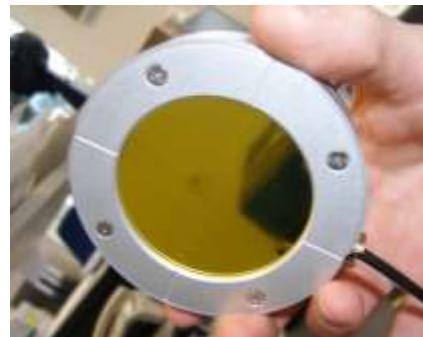

Kraft et al.: NJP 12 (2010) 085003, Zeil et al.: RSI 81 (2010) 013307 & NJP 12 (2010) 045015,
Richter et al.: Med Phys 36 (2009) 5506 & PMB 56 (2011) 1529, Metzkes et al.: NIM A 653 (2011) 172,
Zeil et al.: Nature Comm 3 (2012) 874 & Appl Phys B 110 (2013) 437, Karsch et al.: Z Med Phys 21 (2011) 4

4. Cell irradiation

Proton dosimetry:

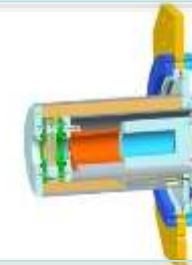

Transmission ionization chamber

- Relative dose per pulse
- Online

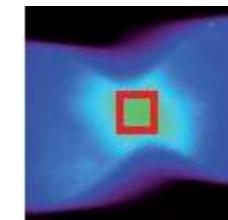

Monitoring of all cell and dosimeter irradiation

- Dose rate independent **absolute dose** per pulse
- Online

Faraday cup

- Dose rate independent **absolute dose**
- Spatial dose distribution
- Retrospective

Radiochromic film

- Energy distribution
- Online

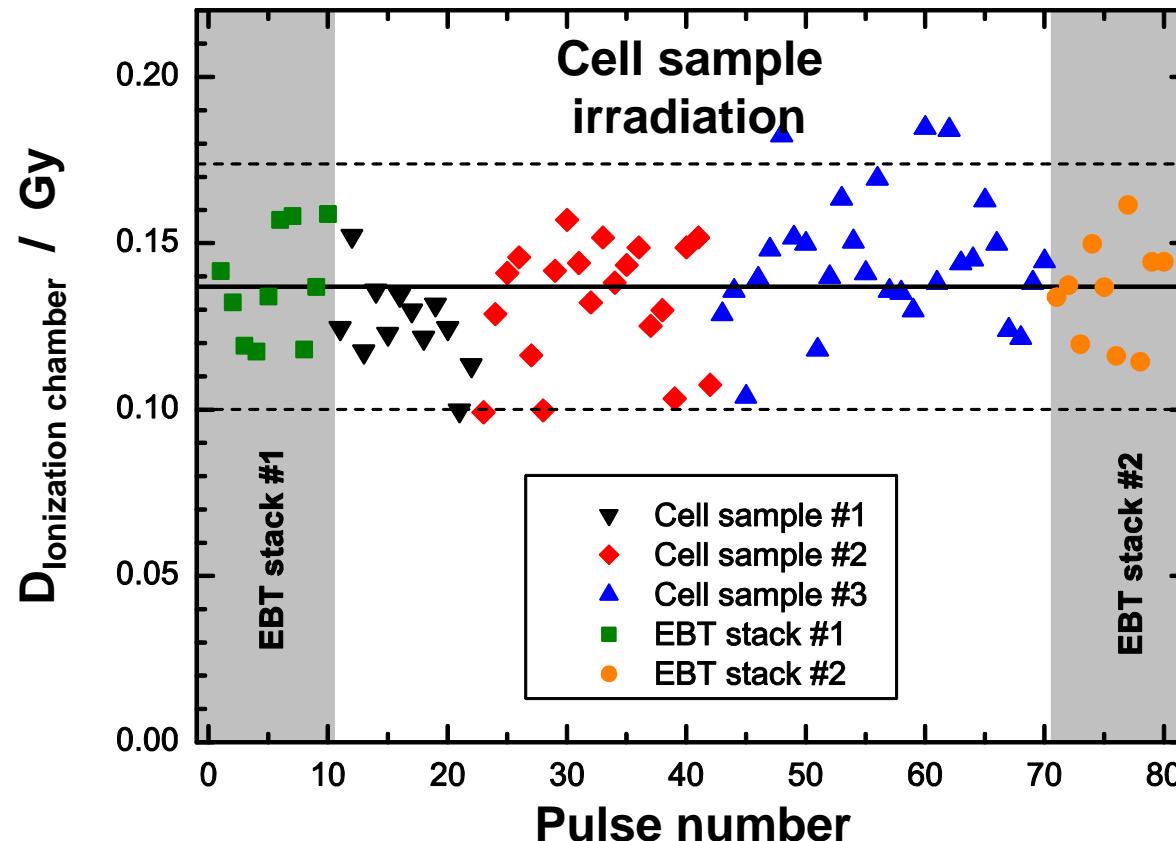

Scintillator

Measuring before and after cell sample irradiation

⇒ **Two independent **absolute** as well as **online** dosimetry systems**

4. Cell irradiation

Proton pulse dose measurement:

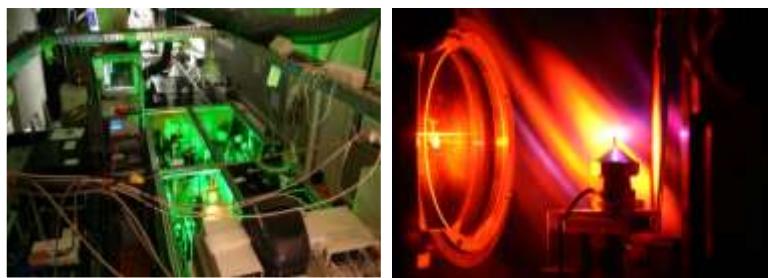

150 TW
DRACO laser

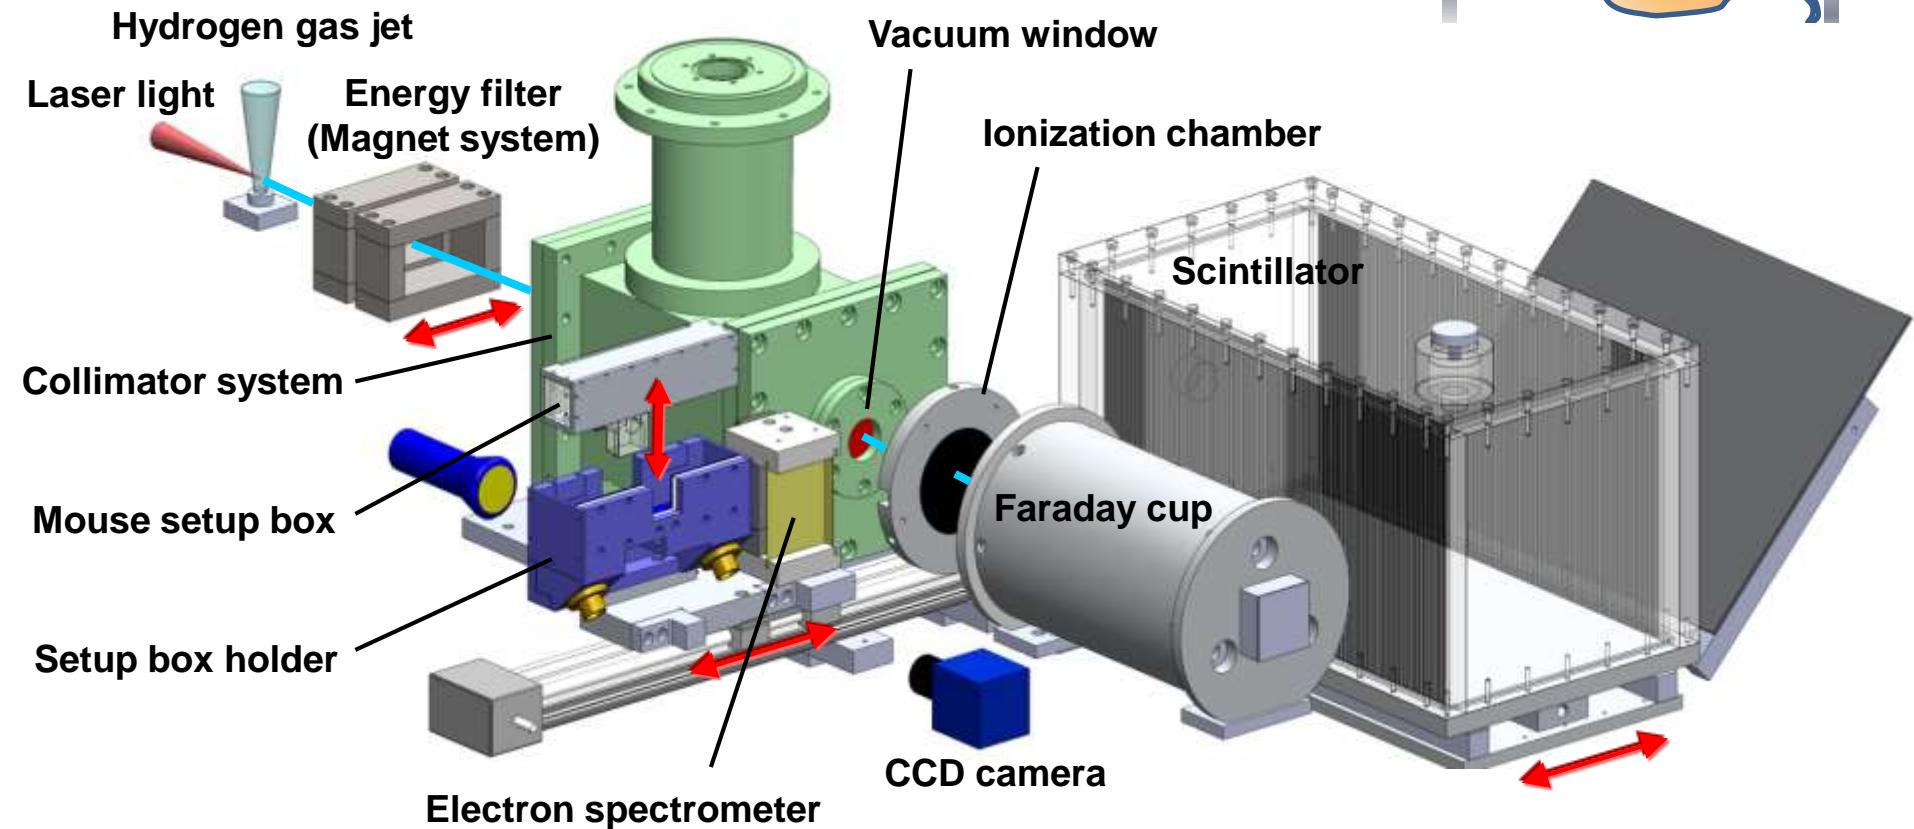

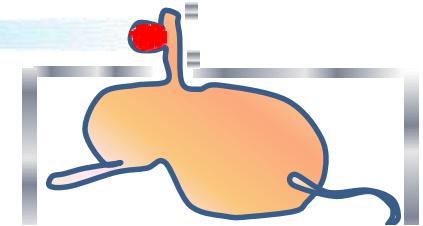

0.14 Gy \pm 28%
per pulse

⇒ **Stable and online monitored pulse-to-pulse operation for controlled irradiation of cell samples**

4. Human tumor irradiation on mice

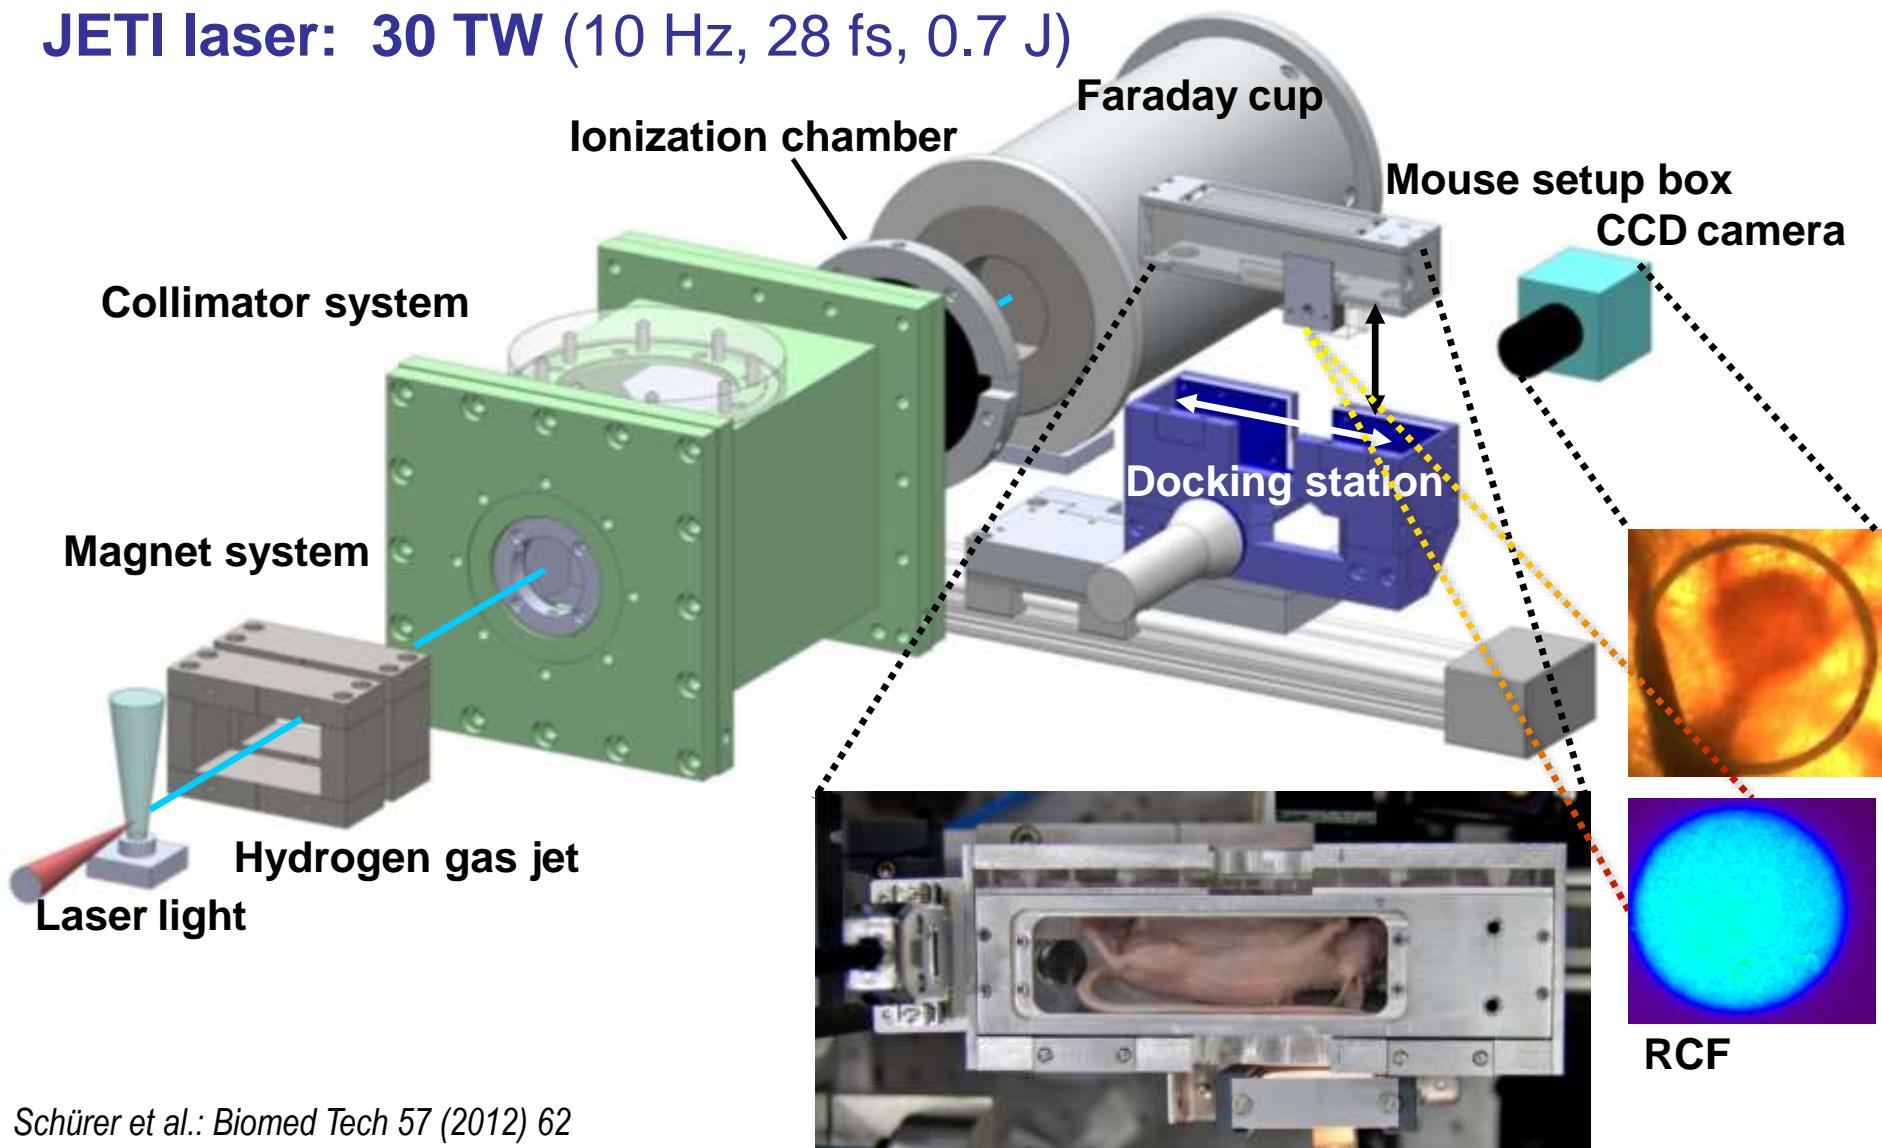

Laser electrons (JETI)

Schürer et al.: Biomed Tech 57 (2012) 62

4. Human tumor irradiation on mice

JETI laser: 30 TW (10 Hz, 28 fs, 0.7 J)

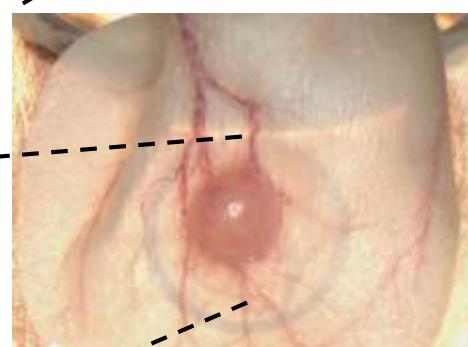

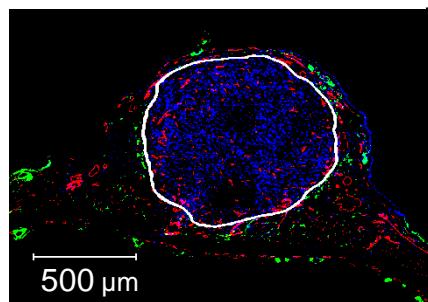

4. Human tumor irradiation on mice

Laser electrons (JETI):

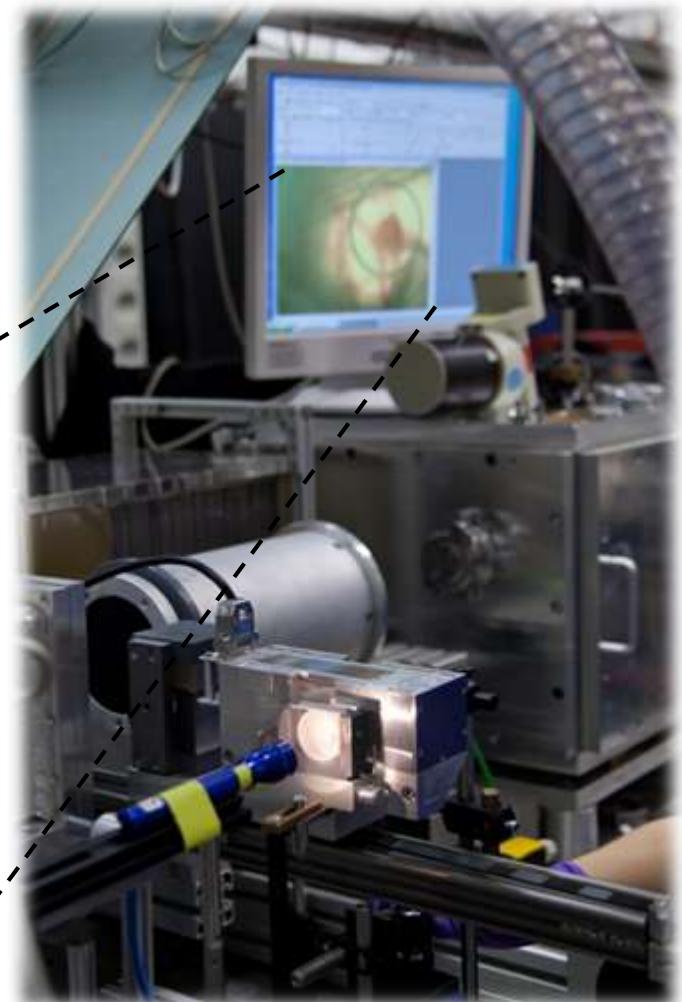

- Preparation and fixation of mouse

- Tumor histology
(perfusion, hypoxia,
blood vessels)

- Verification of tumor position before irradiation

Schürer et al.: Biomed Tech 57 (2012) 62, Brüchner et al.: Radiat Oncol 9 (2014) 57

5. Towards preclinical prototype

Laser-based technology established for irradiation of cells and small animals with:

- ◉ High energy electrons (~ 50 MeV)
- ◉ Low energy protons (~ 25 MeV)

Developing laser-based medical beam delivery unit:

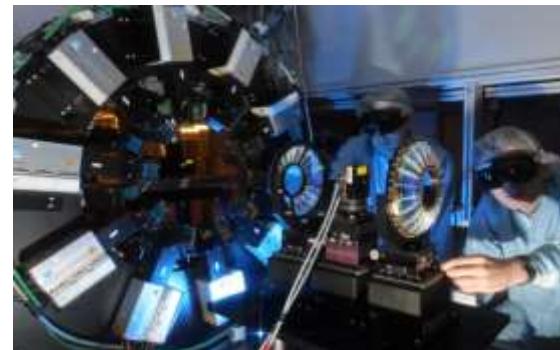

- ◉ Increase proton energy from ~ 25 MeV to ~ 250 MeV
- ◉ Irradiation of large tumor volumes
- ◉ From fixed beam irradiation to dose delivery by rotating gantry

5. Towards preclinical prototype

**Increase of proton energy to ~250 MeV
by petawatt laser power:**

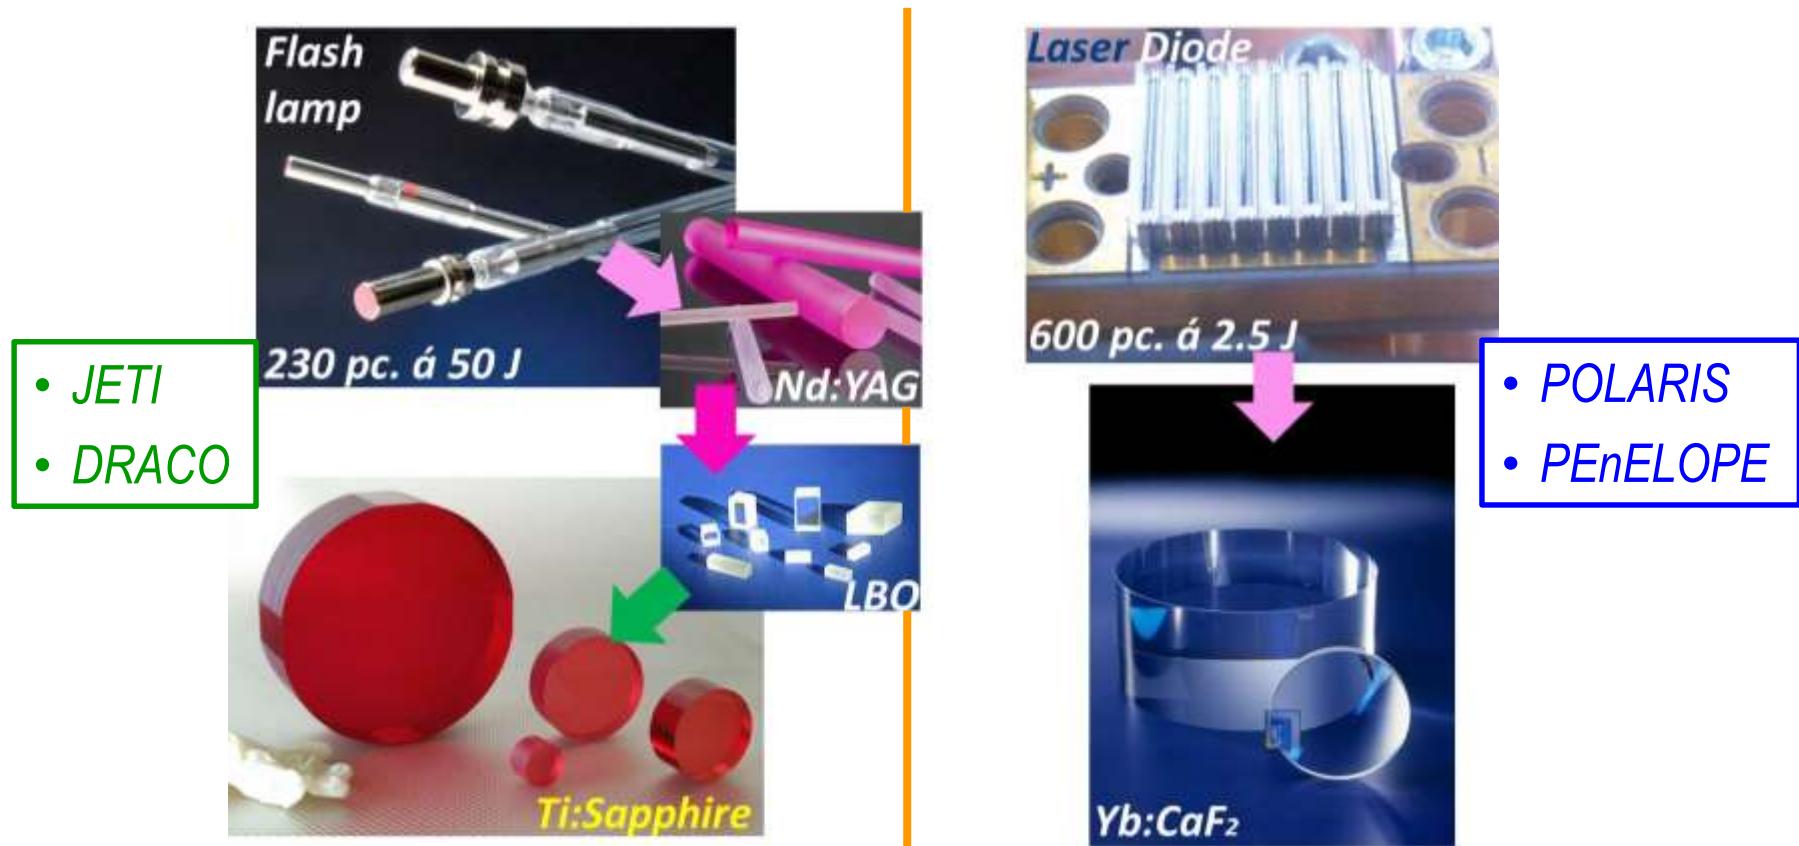

- ◉ **DRACO laser upgrade**
 - 150 TW → **1 PW** (~30 J, ~30 fs, 10 Hz)
- ◉ **Diode pumped laser system POLARIS**
 - **1 PW**; >100 J; 120 fs; 0,03 Hz
 - 100 TW amplifier stage in operation
- ◉ **Diode pumped laser system PENELOPE**
 - **1 PW**; ~150 J; 150 fs; 1 Hz
- ◉ **ELBE center for high power radiation sources**

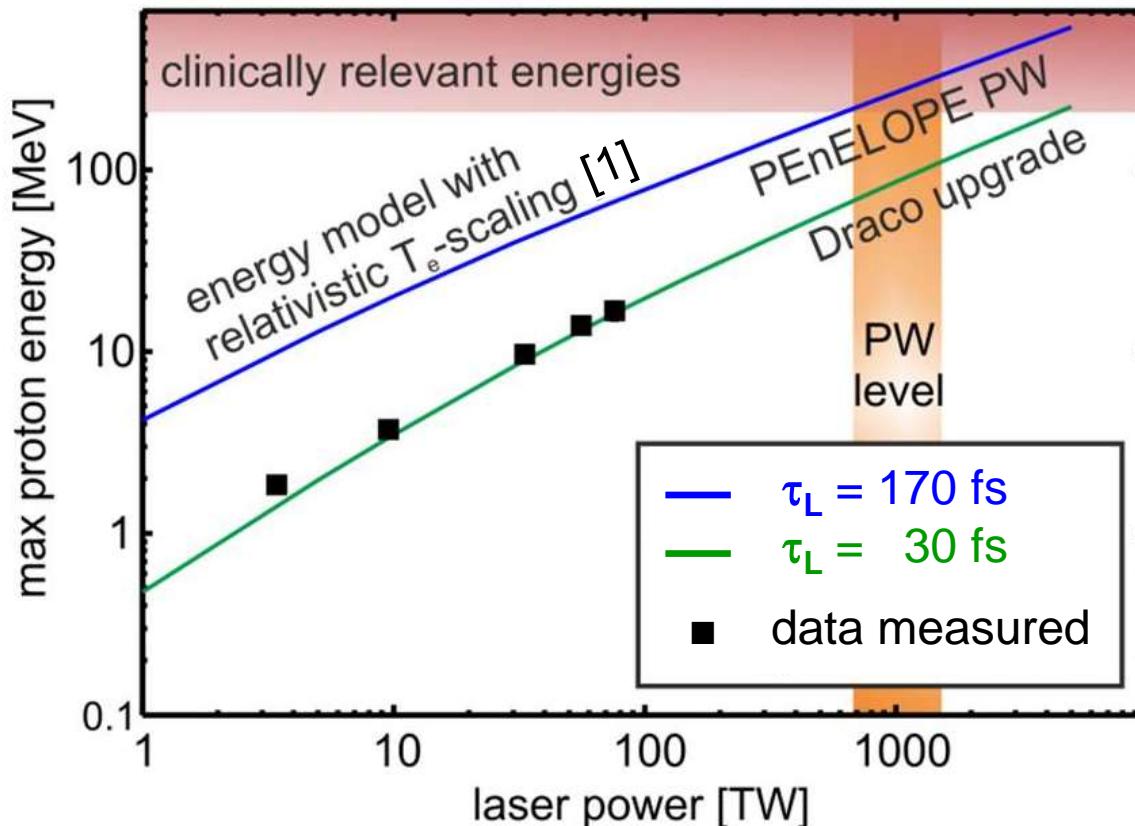

5. Towards preclinical prototype

Two alternative technologies of petawatt laser:

- Ultra-short pulse laser (Ti:Sa, flash lamp pumping, ~30 fs)
- Short pulse laser (Yb:CaF₂, laser diode pumping, ~150 fs)

5. Towards preclinical prototype

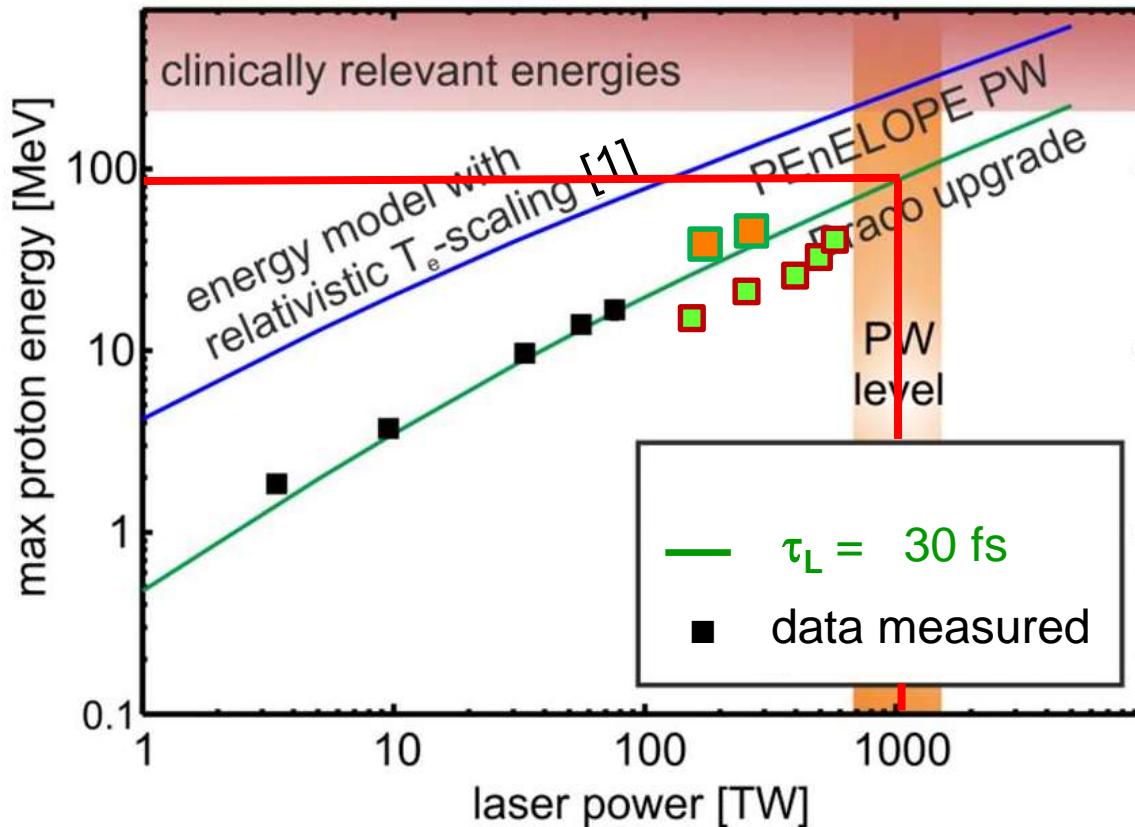

Two alternative technologies of petawatt laser:

- Ultra-short pulse laser (Ti:Sa, flash lamp pumping)
- Short pulse laser (Yb:CaF₂, laser diode pumping)

[1] Kluge et al.: PRL 107 (2011) 205003

5. Towards preclinical prototype

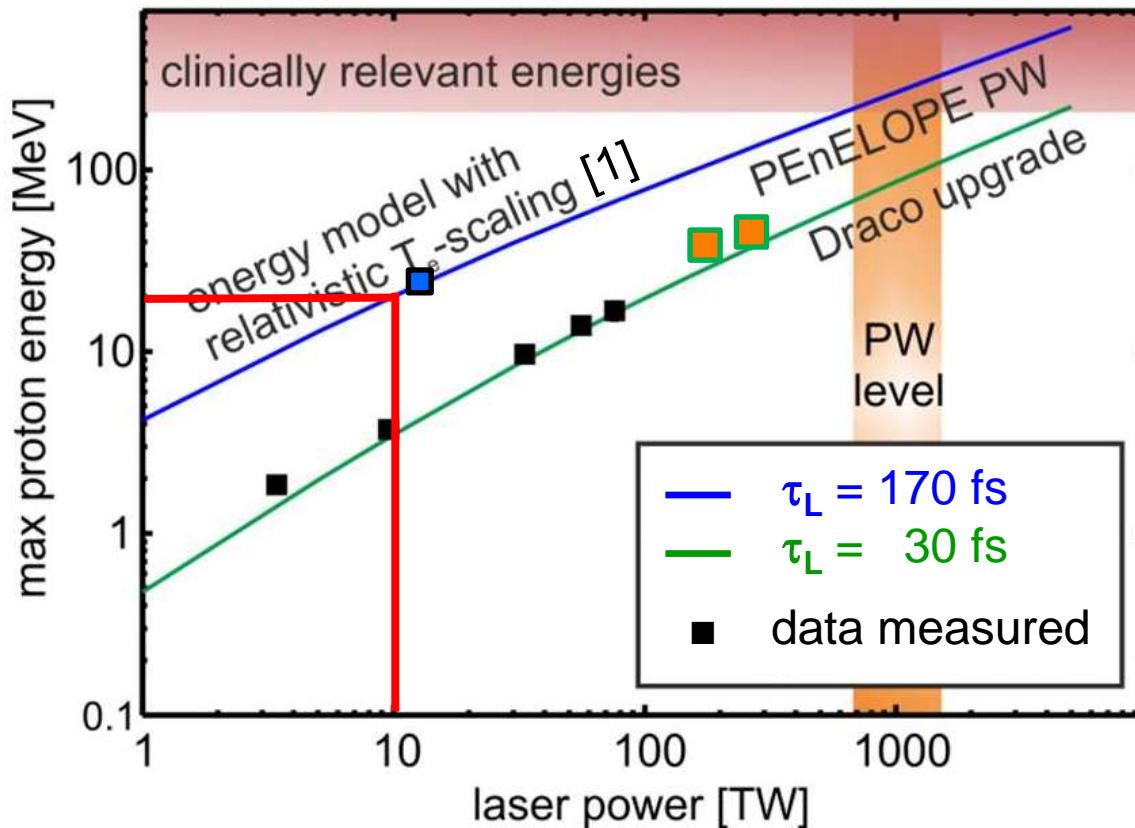

Very preliminary
laser conditions
on target

Other systems:
Ogura et al.: Opt Lett 37 (2012) 2868
Jong Kim et al.: PRL 111 (2013) 165003

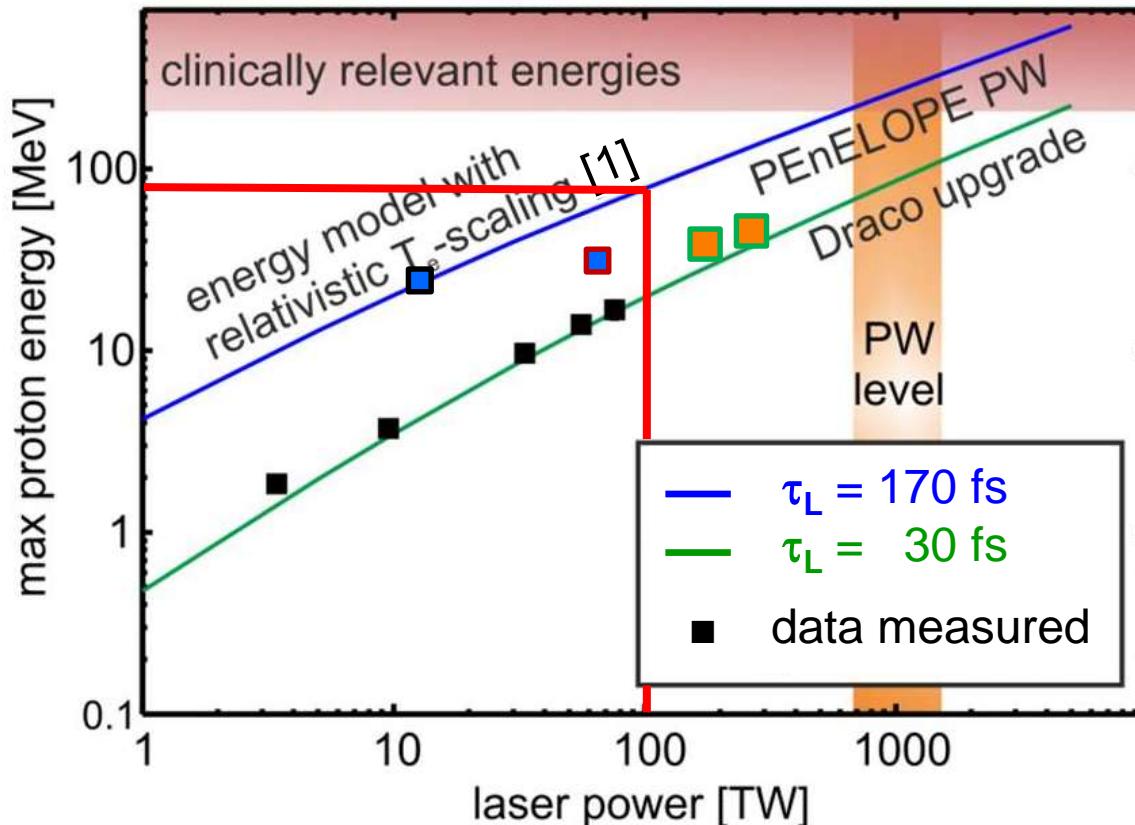

- 2016: **Petawatt class laser DRACO upgrade** (10 Hz, 30 fs, 30 J)
 - In cooperation with Amplitude Technologies, France
 - Proton acceleration up to ~90 MeV
 - In vivo experiments in progress

5. Towards preclinical prototype

- 2013: Petawatt class **laser POLARIS** (0.03 Hz, 120 fs, 120 J)
 - In-house development
 - **10 Terawatt amplifier stage** in operation

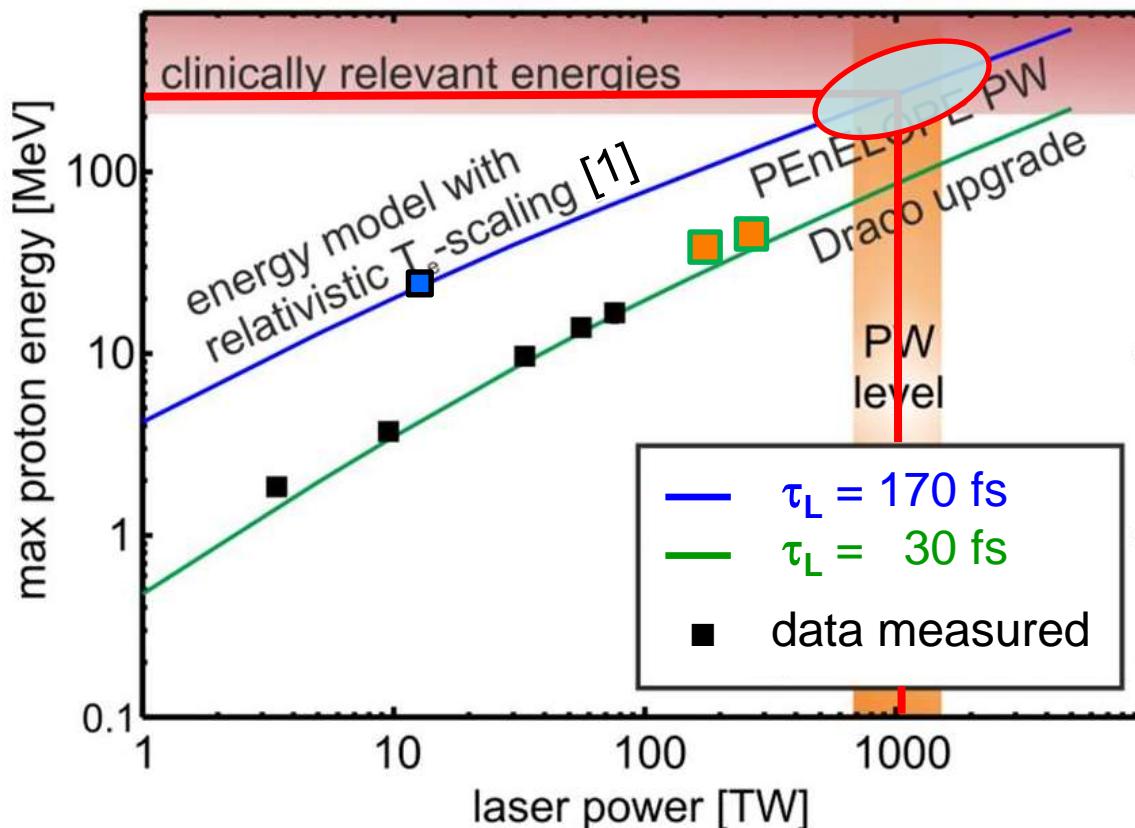

5. Towards preclinical prototype

Temporal pulse contrast problems

- 2016: Petawatt class **laser POLARIS** (0.03 Hz, 120 fs, 120 J)
 - In-house development
 - **100 Terawatt amplifier** stage in operation

5. Towards preclinical prototype

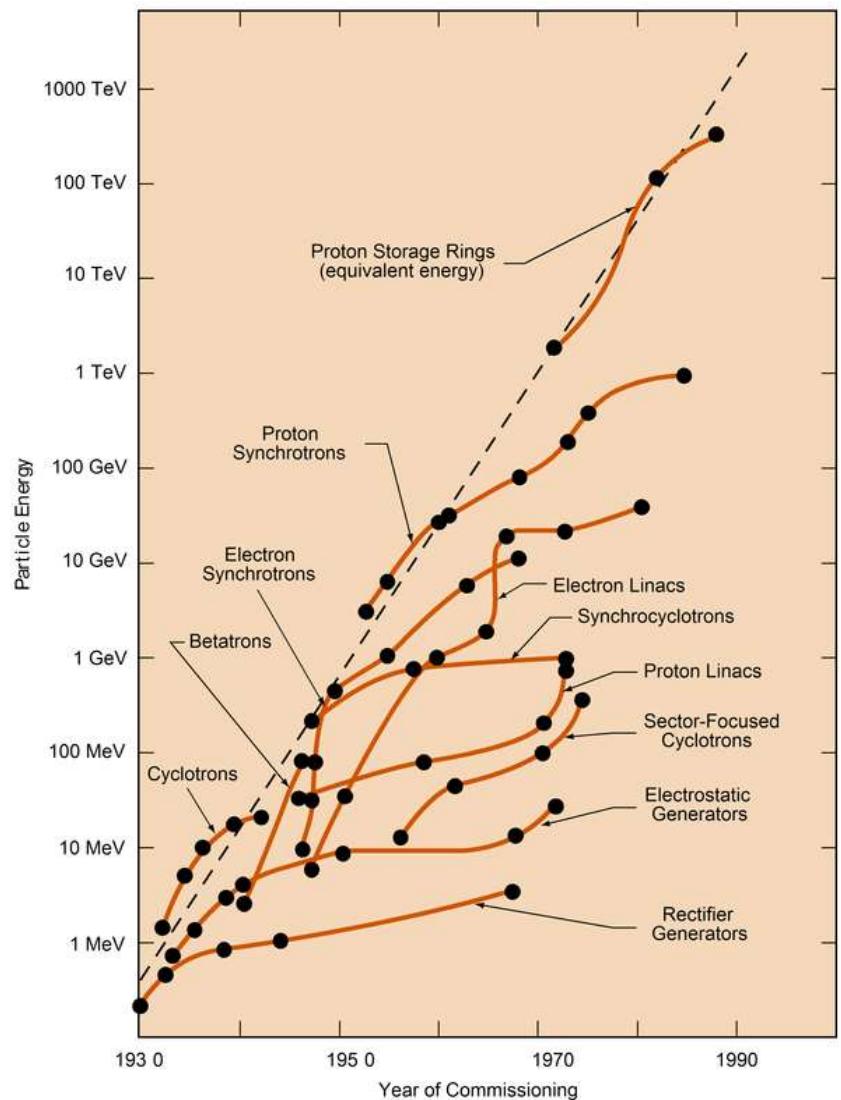

- 2017: **Petawatt class laser PENELOPE** (1 Hz, 150 fs, 150 J)
 - In-house development, optimized for pulse contrast
 - Under construction

5. Towards preclinical prototype

Livingstone chart:

- Achieved maximum particle energy for different accelerators
- Energy increases on average by a factor of ~33 within 10 years (almost independent from the acceleration principle)
- 10 Hz Ti:Sa laser systems:
Maximum proton energy from 2 MeV in 2006 to 45 MeV in 2013 (factor 23 within 7 years)

Proc. Snowmass 2001 Conf., eConf C010630, SLAC-R-599

<http://www.ischebeck.net/media/Accelerator%20Physics/Advanced%20Accelerator%20Concepts/Livingston%20Plot/Livingston%20Plot%201.png> (12.04.2017)

5. Towards preclinical prototype

ELBE center for high power radiation sources:

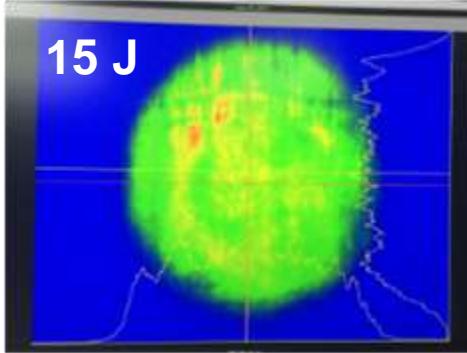

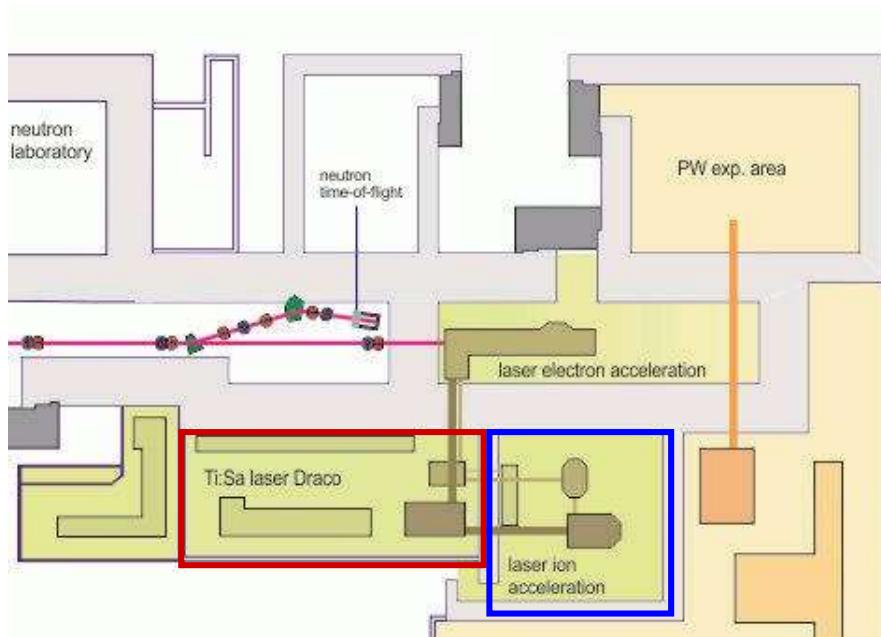

- Superconducting electron linear accelerator
- 1 PW DRACO upgrade & 1 PW PEnELOPE

Funded by Free State of Saxony, 20 Mill. €

5. Towards preclinical prototype

ELBE center for high power radiation sources:

- 1 PW DRACO upgrade installed
- 700 TW in routine operation

5. Towards preclinical prototype

Dosimetry:

- Clinical standard: absolute dose measurement by (air-filled) ionization chambers

- Requires recombination correction

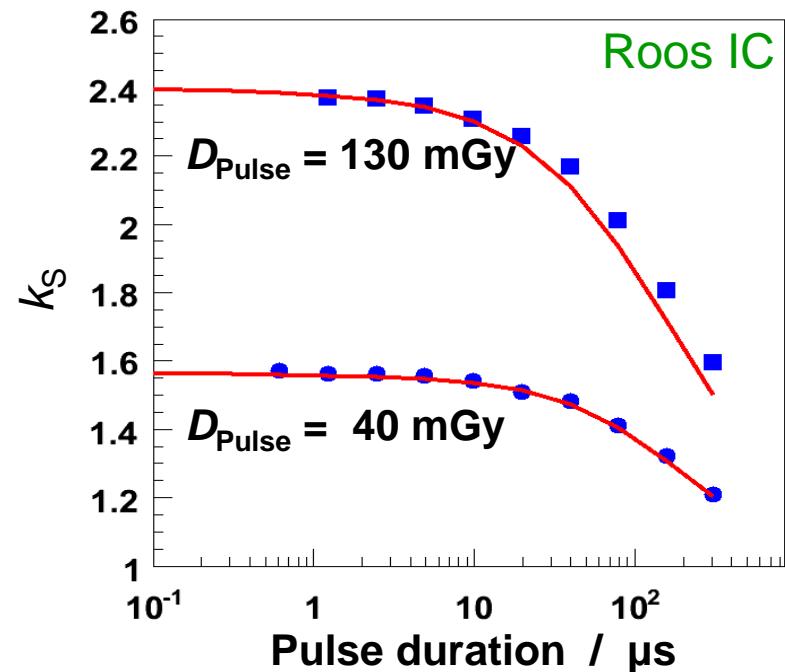

$$k_s = \frac{\text{released charge}}{\text{collected charge}}$$

- Established for continuous beams and low-dose single pulse exposure

- For pulsed radiation fields of arbitrary pulse duration and repetition rate:

Experimental determination *

Theoretical description *

Karsch: Phys Med Biol 61 (2016) 3222 & Med Phys 43 (2016) 6154

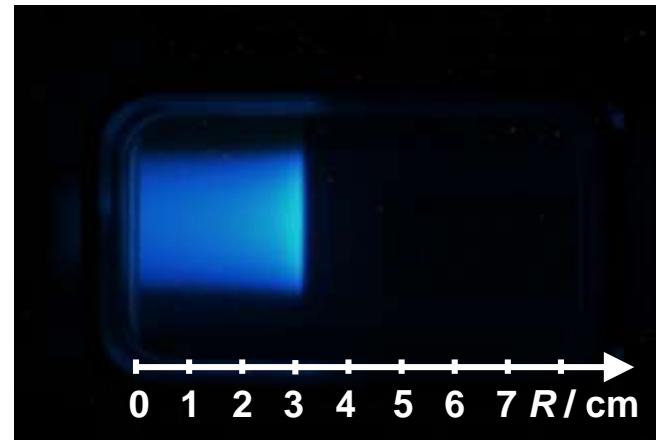

5. Towards preclinical prototype

Dosimetry:

- Online measurement of 3D dose distribution for single pulses
- Scintillator block and optical tomography
- First small-scale prototype
- Proof-of-principle irradiation tests (γ , e^- , p)
- Promising dosimetry method
- Prototype sufficient for development of laser-driven proton therapy at current stage

→
**Proton beam
(60 MeV)**

5. Towards preclinical prototype

Dose delivery to large tumor volumes:

• Laser-driven beams:

- broad energy spectrum,
- large beam divergence
- limit of low number of pulses (10 min @ 10 Hz → 6000 pulses)

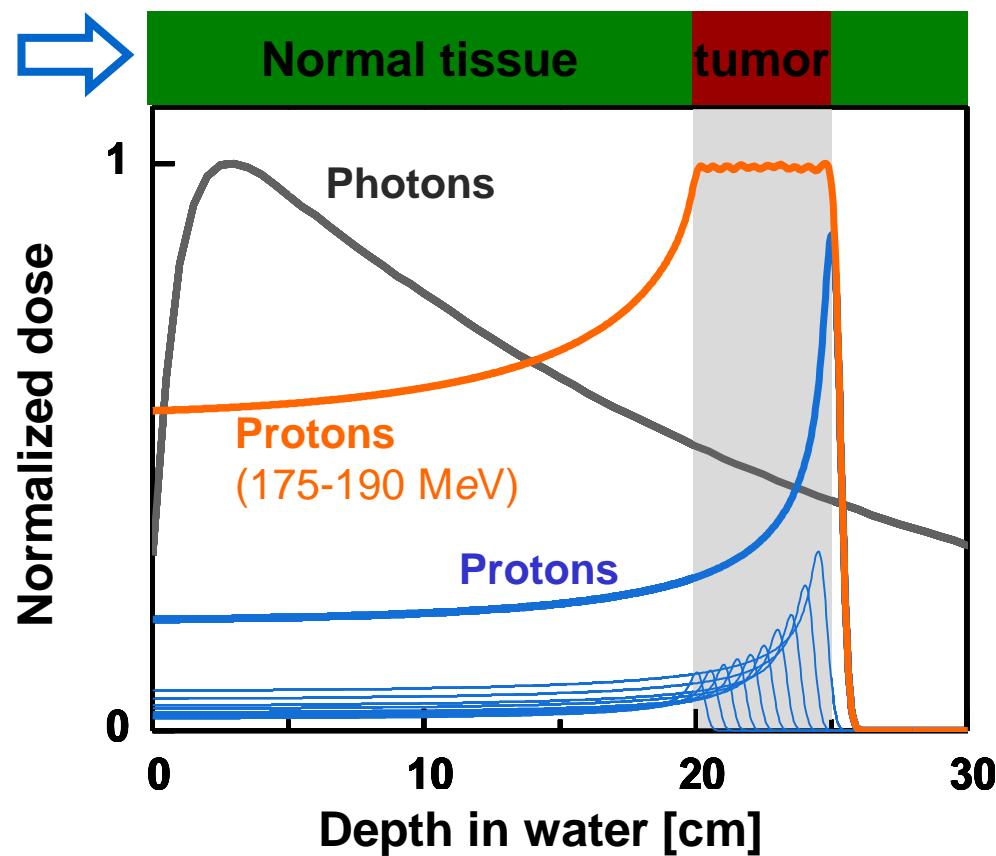

• Straightforward approach:

- Apply conventional dose delivery systems
⇒ *Select monoenergetic, pencil-like beams*

5. Towards preclinical prototype

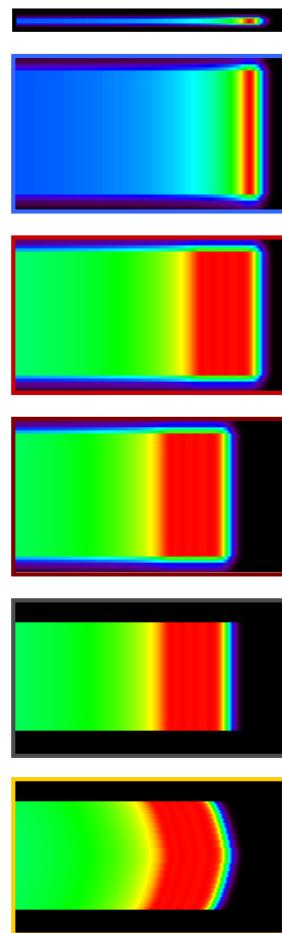

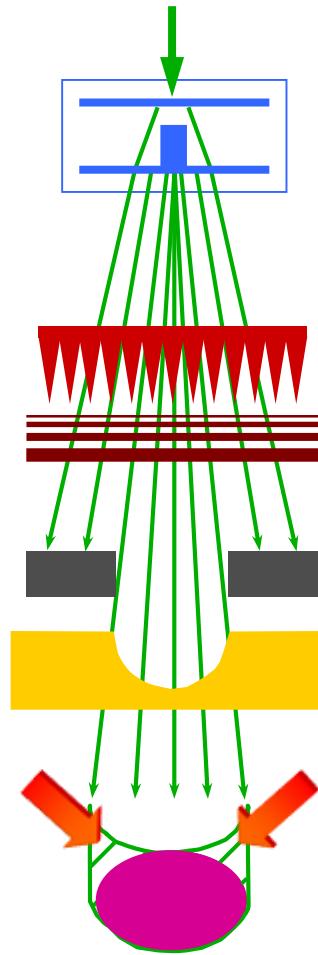

Dose delivery: Spread-out Bragg peak (SOBP) formation

- Monoenergetic beams

5. Towards preclinical prototype

Dose delivery: Passive irradiation field formation

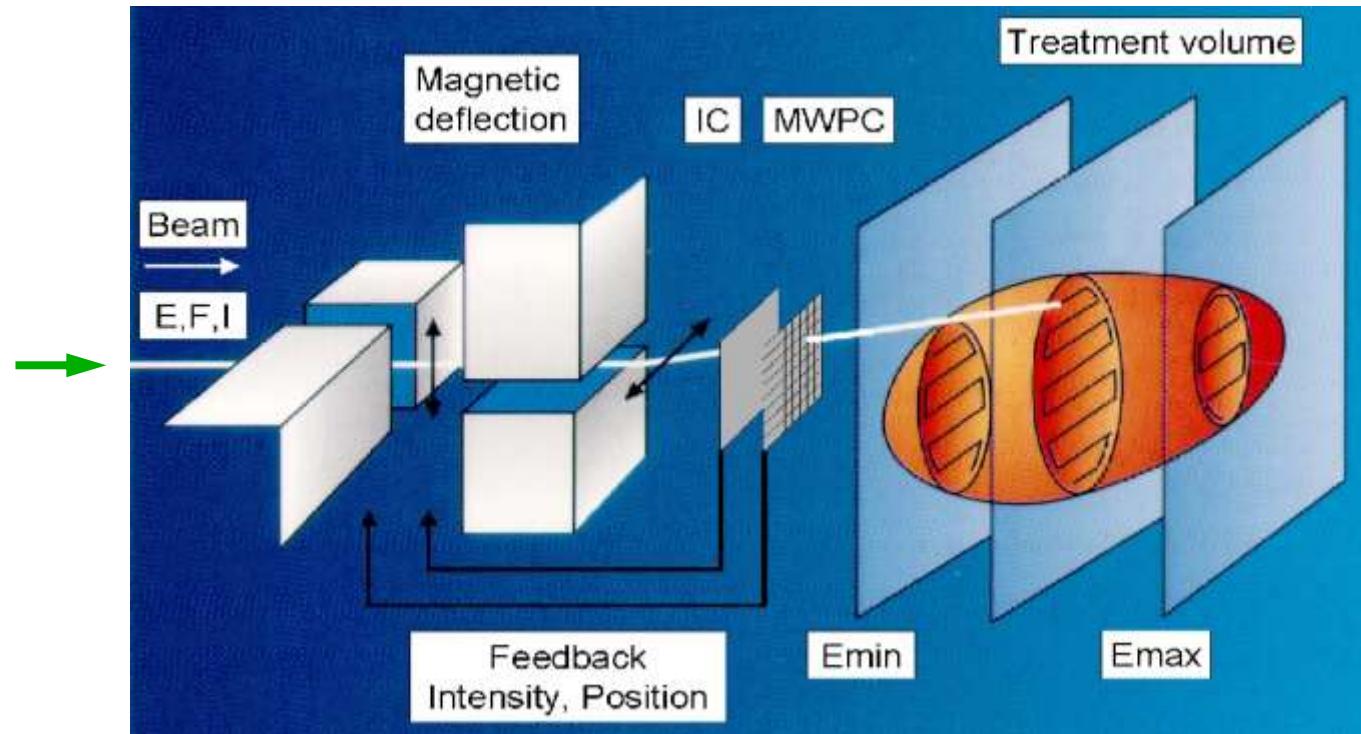

- Adapt monoenergetic pencil-like ion beam to 3D tumor contour
- 2D lateral beam widening by scatterer / scanning magnets
- Beam widening in beam direction by range modulator (\Rightarrow SOBP)
- Shift of SOBP in beam direction by range shifter
- Adapt irradiated area to tumor contour: lateral by collimator
 - distal by range compensator
- **High dose region (healthy tissue)**

D. Schardt et al.: Rev. Mod. Phys. 82 (2010) 383

5. Towards preclinical prototype

Dose delivery: Pencil beam scanning (GSI)

T. Haberer et al.: Nucl. Instrum. Meth. A330 (1993) 296

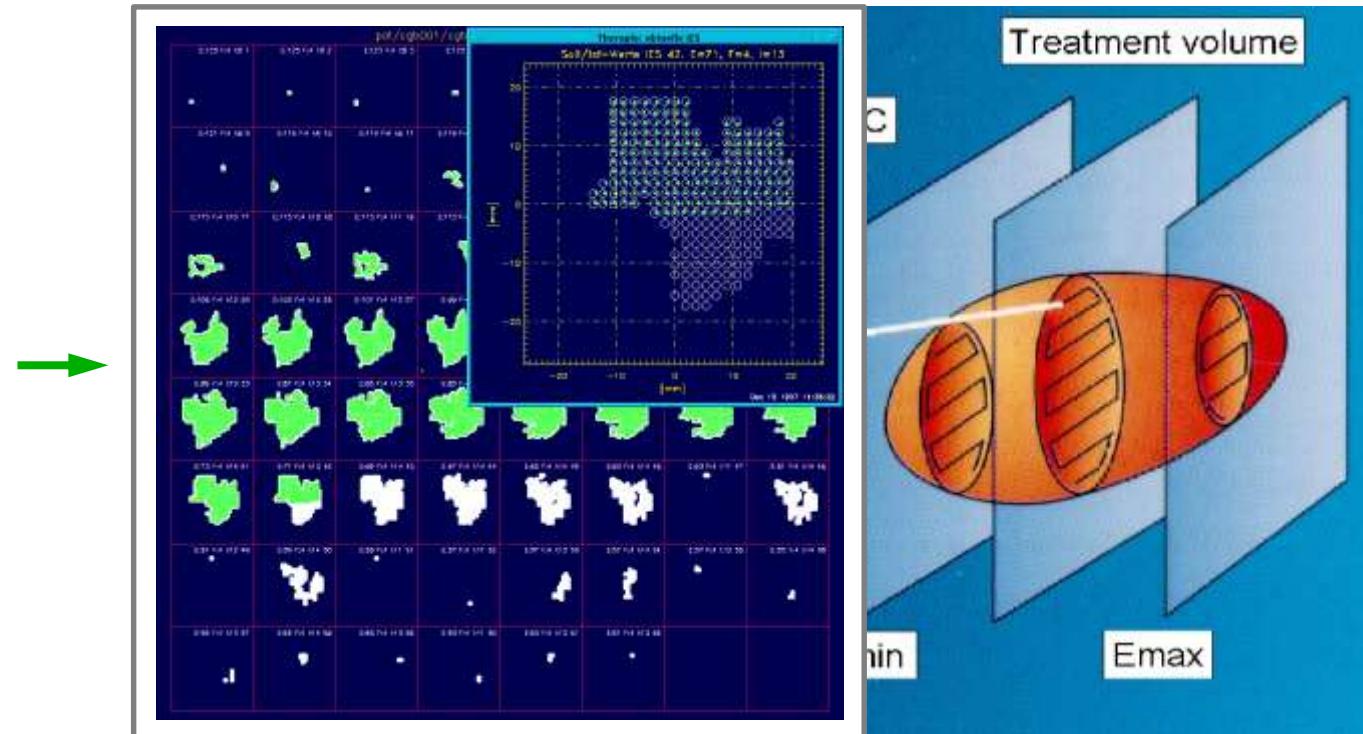

- ⌚ Monoenergetic pencil beams from accelerator $(F = 4 - 10 \text{ mm } \varnothing)$
- ⌚ Magnetic deflection (horizontal, vertical)
- ⌚ Range modulation by energy variation $(E_{12C} = 1 - 5 \text{ GeV})$
- ⌚ Intensity controlled scanning $(I = 10^6 - 10^8 \text{ } ^{12}\text{C}/\text{s})$

5. Towards preclinical prototype

Dose delivery: Pencil beam scanning (GSI)

T. Haberer et al.: Nucl. Instrum. Meth. A330 (1993) 296

- ⌚ Monoenergetic pencil beams from accelerator $(F = 4 - 10 \text{ mm } \varnothing)$
- ⌚ Magnetic deflection (horizontal, vertical)
- ⌚ Range modulation by energy variation $(E_{12\text{C}} = 1 - 5 \text{ GeV})$
- ⌚ Intensity controlled irradiation of up to ~ 27000 spots $(30 \cdot 30 \cdot 30)$

5. Towards preclinical prototype

Dose delivery to large tumor volumes:

• Laser-driven beams:

- Broad energy spectrum,
- Large beam divergence
- Limit of low number of pulses (10 min@10 Hz → 6000 pulses)

• Straightforward approach:

- Apply conventional dose delivery systems (pencil beam scanning)
 - ⇒ *Select monoenergetic, pencil-like beams*
 - ⇒ *Dump a large number of protons (~95%)*
 - ⇒ *Production of a high level of secondary radiation*

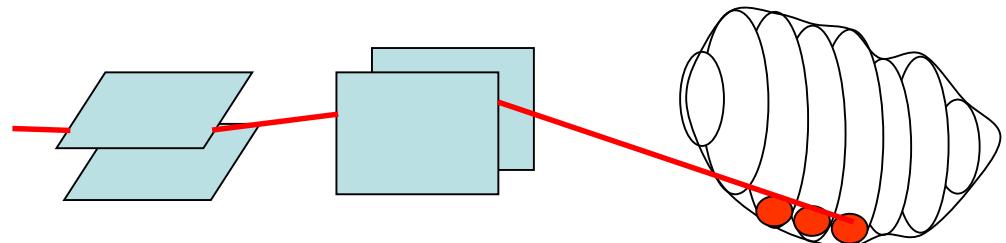

5. Towards preclinical prototype

Dose delivery to large tumor volumes:

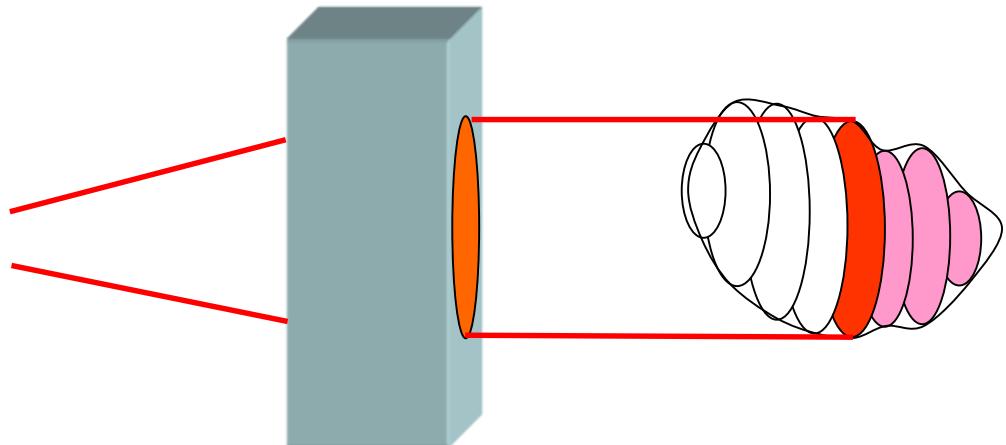

New concept:

- Deliver as much particles as available and useful

1. Approach
Pencil beam +
defined **broad energy** spectrum

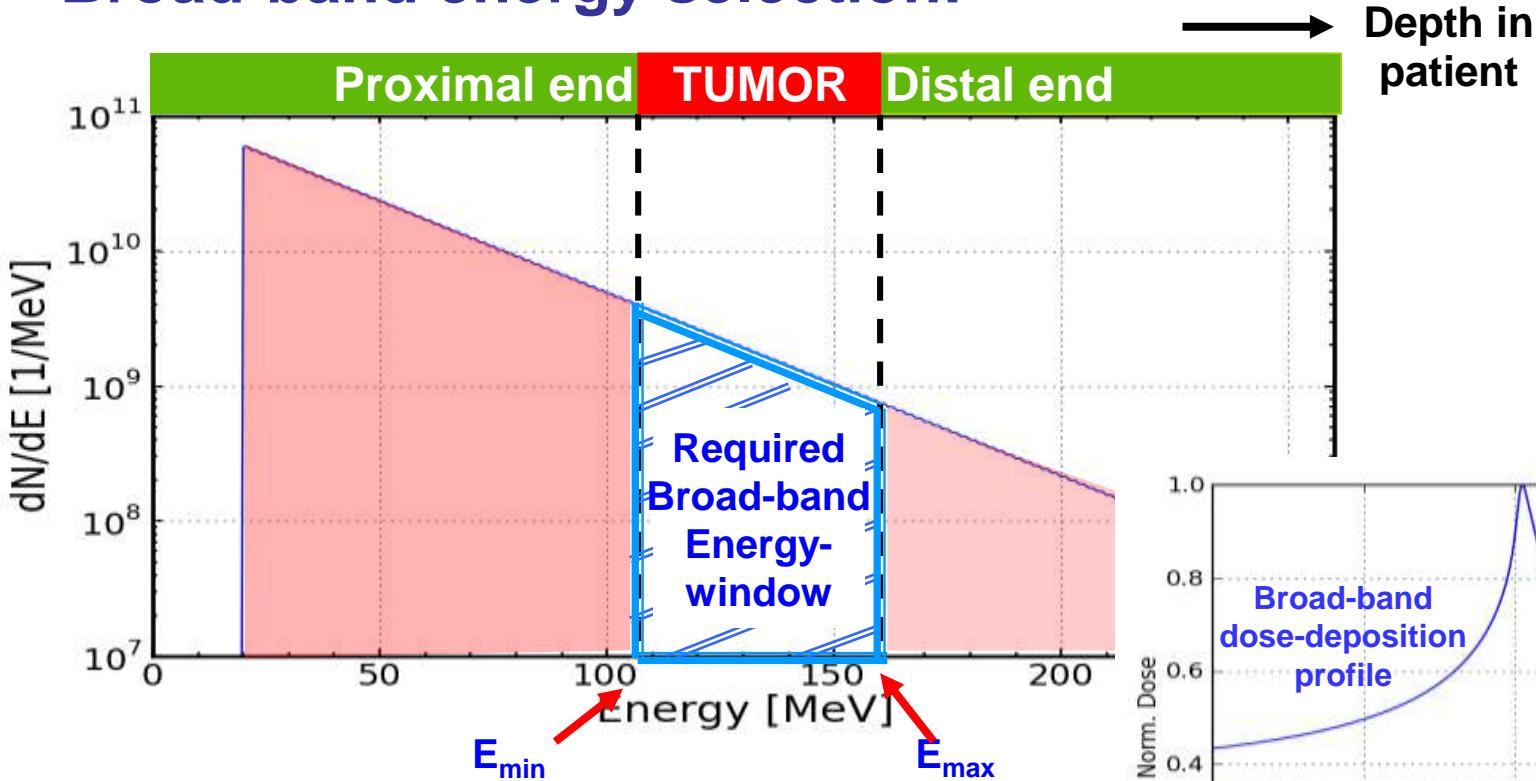

2. Approach
Wide beam +
quasi-monoenergetic

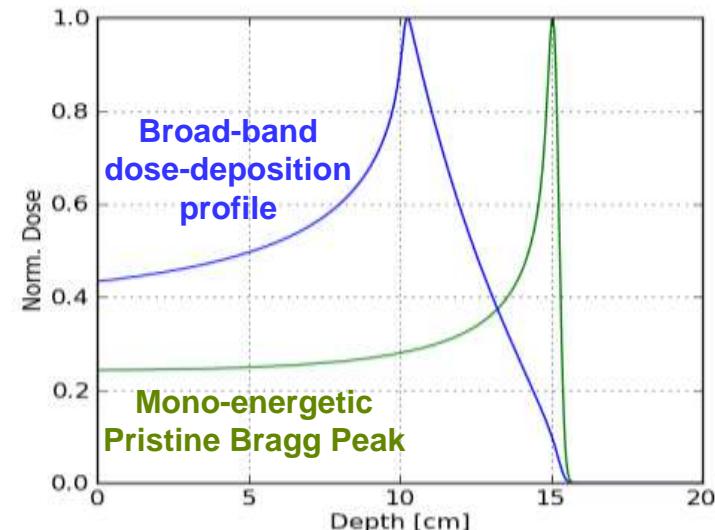

5. Towards preclinical prototype

Broad-band energy selection:

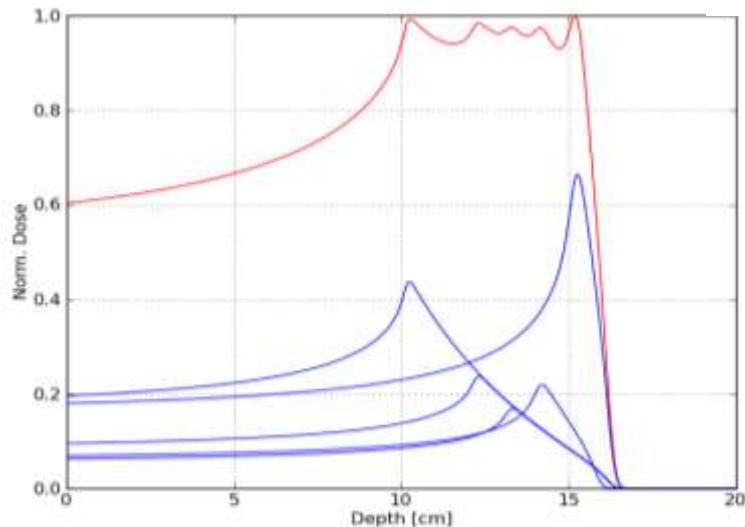

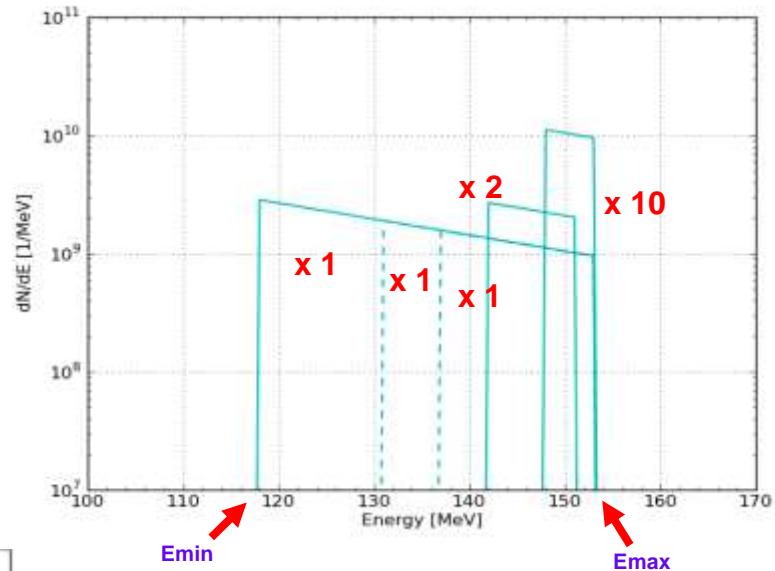

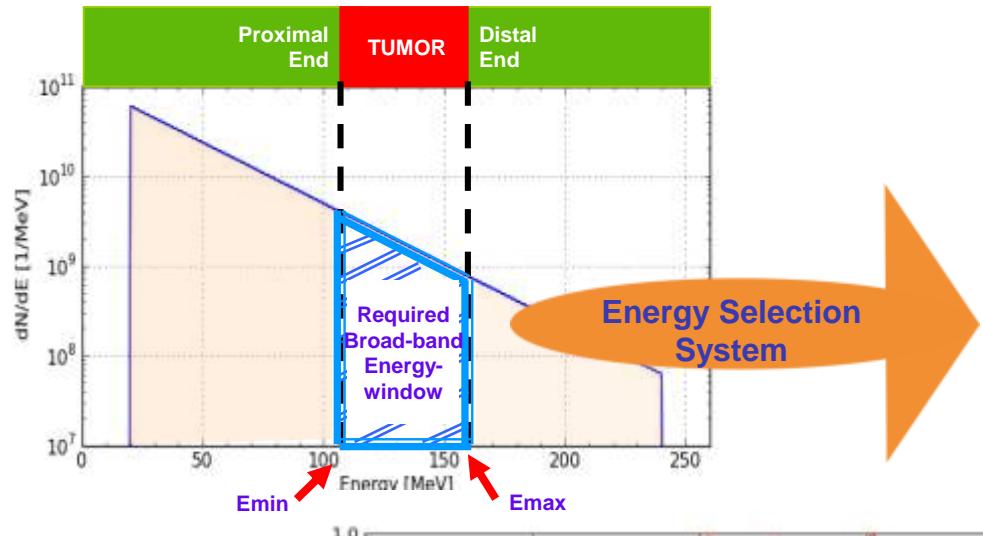

- Scaled spectrum from experimental data, for therapeutical energy range
- Assume arbitrary energy selection system capable to filter Broad-band Energy-window

5. Towards preclinical prototype

Broad-band energy selection:

Total: 15 pulses

Masood et. al.: Appl Phys B 117 (2014) 41

5. Towards preclinical prototype

Dose delivery by rotating gantry:

New Concept:

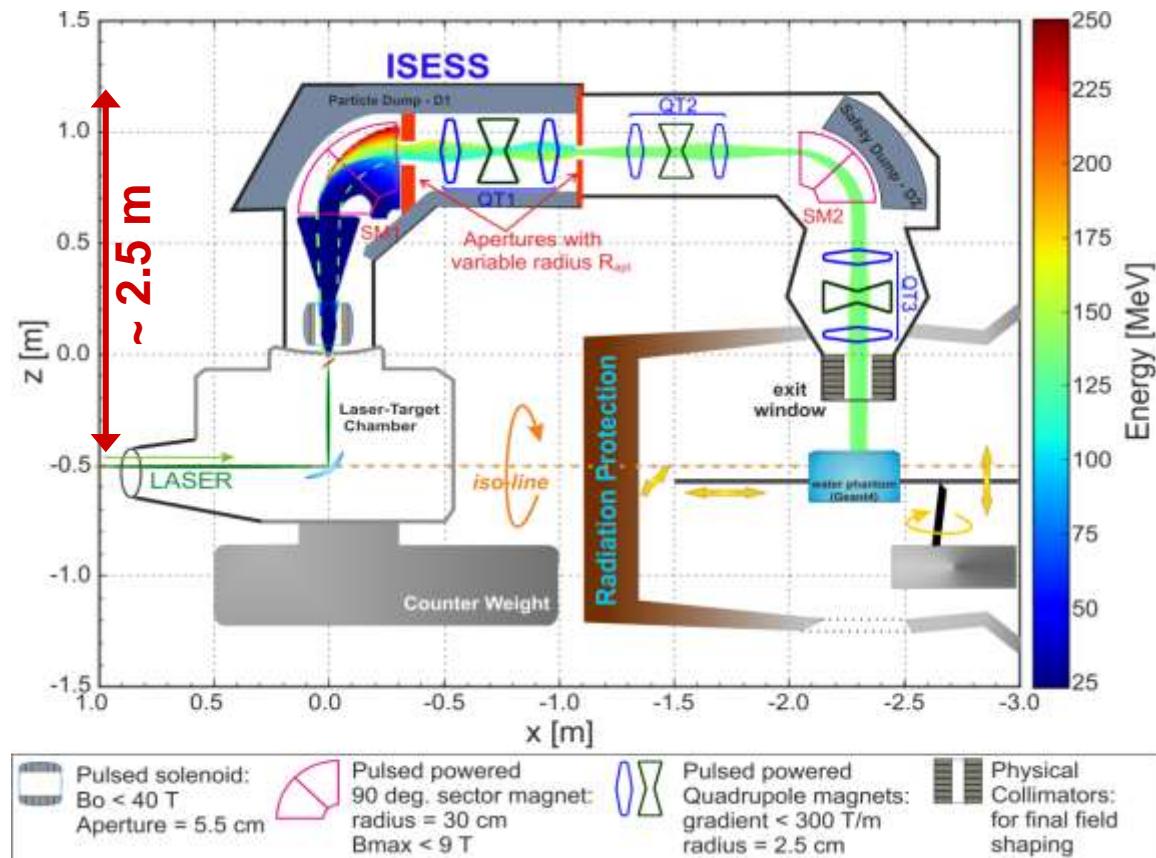

- Pulsed nature of laser-driven beams
- Use pulse powered magnets
 - Higher magnetic field for more compact designs
 - Lower weight
- Conventional (iron-core) magnets:
 - $B_{\max} \sim 2 \text{ T}$ (iron magnetization limit)
- Pulse powered (air-core) magnets:
 - $B_{\max} > 10 \text{ T}$ (current limit)
 - ⇒ *Mechanical strength for intense magnetic pressure (high current pulses)*

Masood et. al.: *Appl Phys B* 117 (2014) 41

5. Towards preclinical prototype

Gantry design:

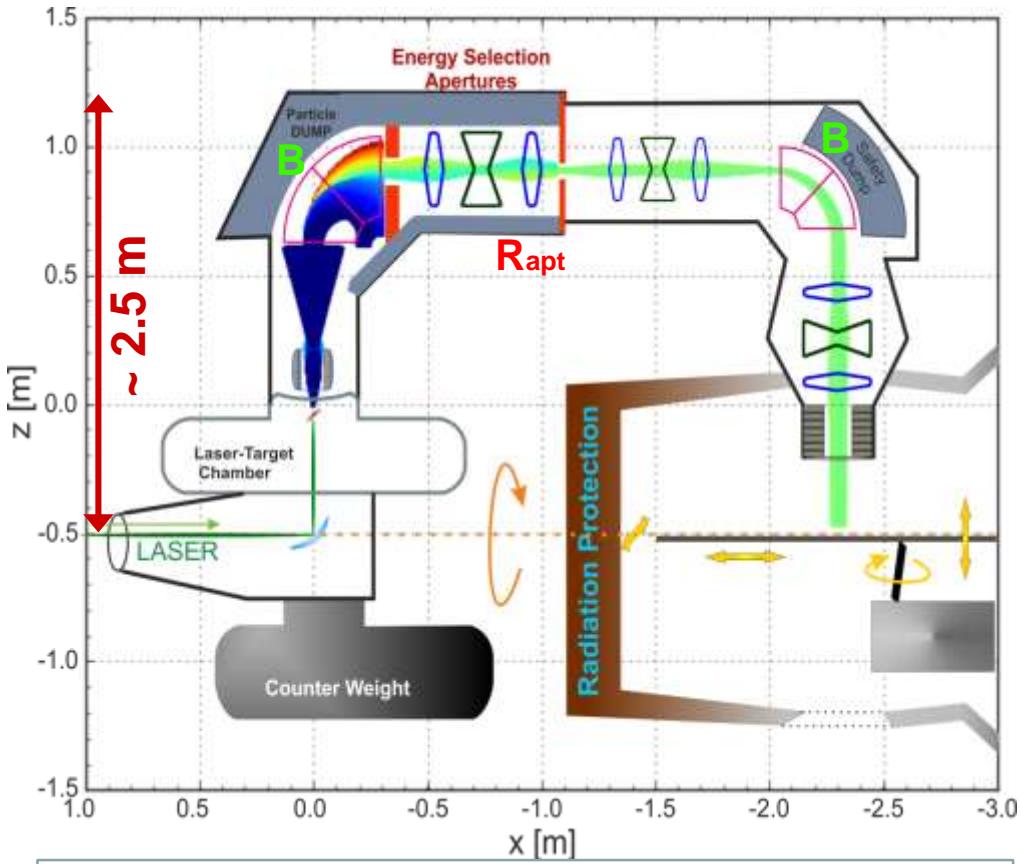

- Laser target chamber integration
- Broad energetic beam delivery (3 – 20%)
- High beam transport efficiency (20 – 97%)
- Variable beam spot size
- High-field pulse powered magnets
- More compact (only half size)

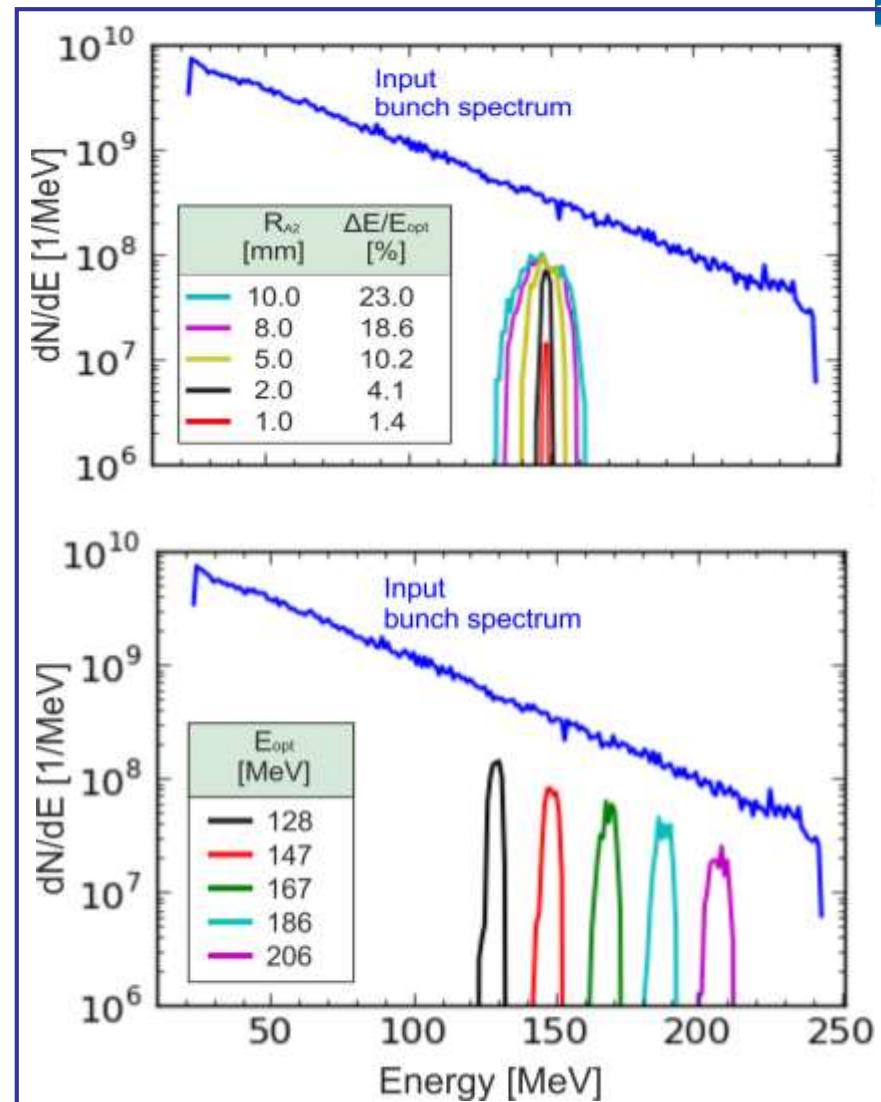

Masood et. al.: Appl Phys B 117 (2014) 41 & Phys Med Biol 62 (2017) 5531

5. Towards preclinical prototype

Gantry design:

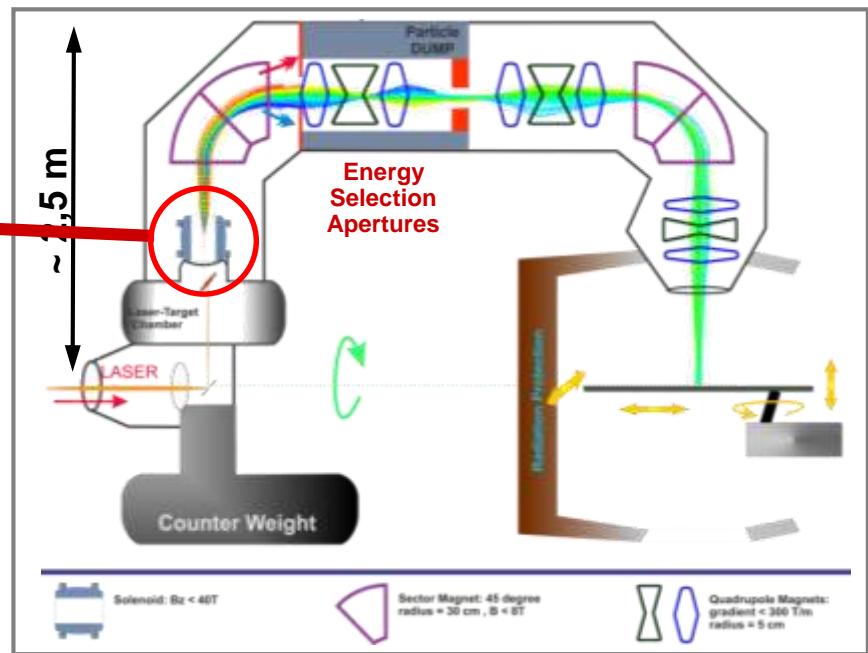

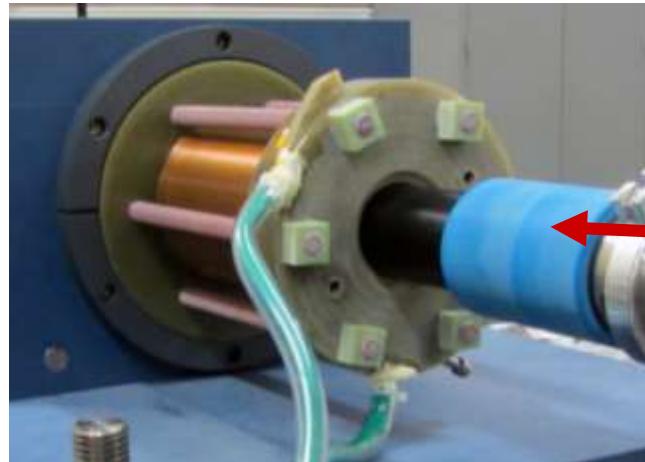

- | | | | | | |
|--|--|--|--|--|---|
| | Pulsed powered Solenoid:
$B_0 < 40$ T | | Pulsed powered 90 deg. sector magnet:
radius = 30 cm
$B_{max} < 8$ T | | Pulsed powered Quadrupole magnets:
gradient < 300 T/m
radius = 2.5 cm |
|--|--|--|--|--|---|

5. Towards preclinical prototype

Pulse powered solenoid:

- Beam capture and focusing
- Several prototypes (B_0 : ~50 T) developed
- Tested and applied at laser-driven proton beams

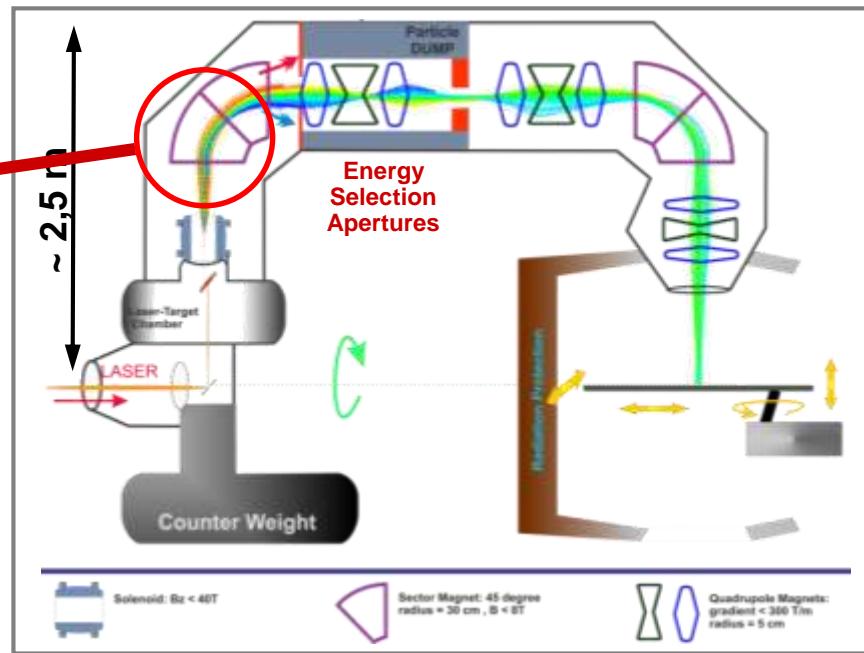

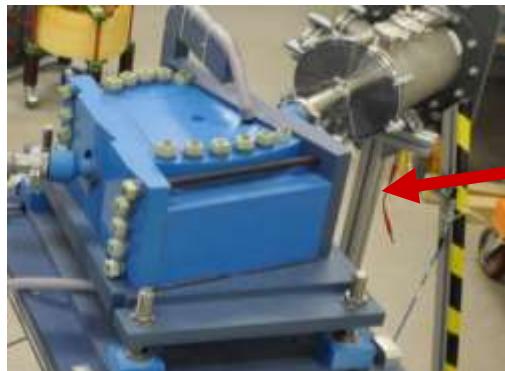

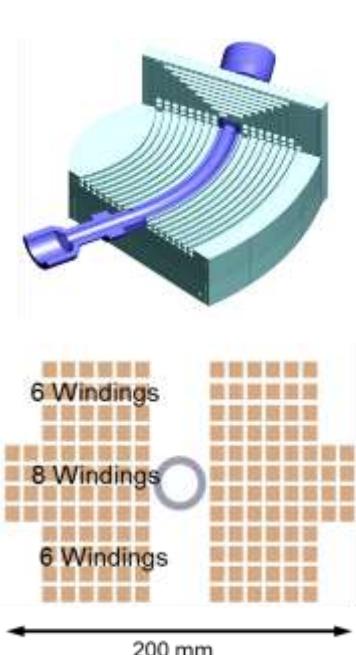

Burris-Mog et al.: PR STAB 14 (2011) 121301, Busold et al.: PR STAB 16 (2013) 101302

5. Towards preclinical prototype

Pulse powered dipole:

- Beam bending and energy selection
- Designed (magnetic strength ~10 T, 45° bending → ~200 MeV)
- Manufactured and characterized at pulsed proton beams

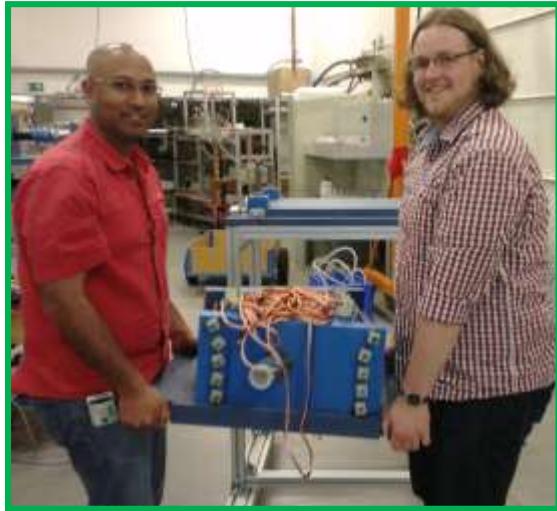

Schürer et al.: Patent application DE 10 2015 200 213.6 (9.1.2015)

5. Towards preclinical prototype

Pulse powered dipole:

- Beam bending and energy selection

Schürer et al.: Patent application DE 10 2015 200 213.6 (9.1.2015)

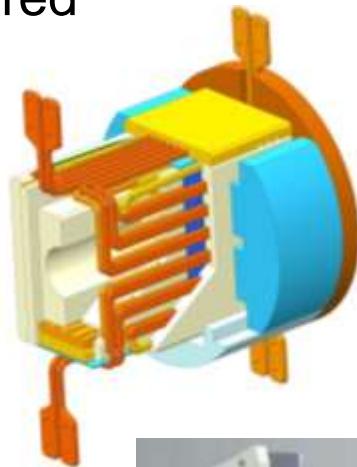

5. Towards preclinical prototype

Pulse powered quadrupole:

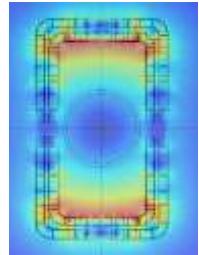

- Beam shaping and correction
- Multi layer design: High gradient $\sim 250 \text{ T/m} \rightarrow \sim 6 \text{ T}$ at poles
- Manufactured

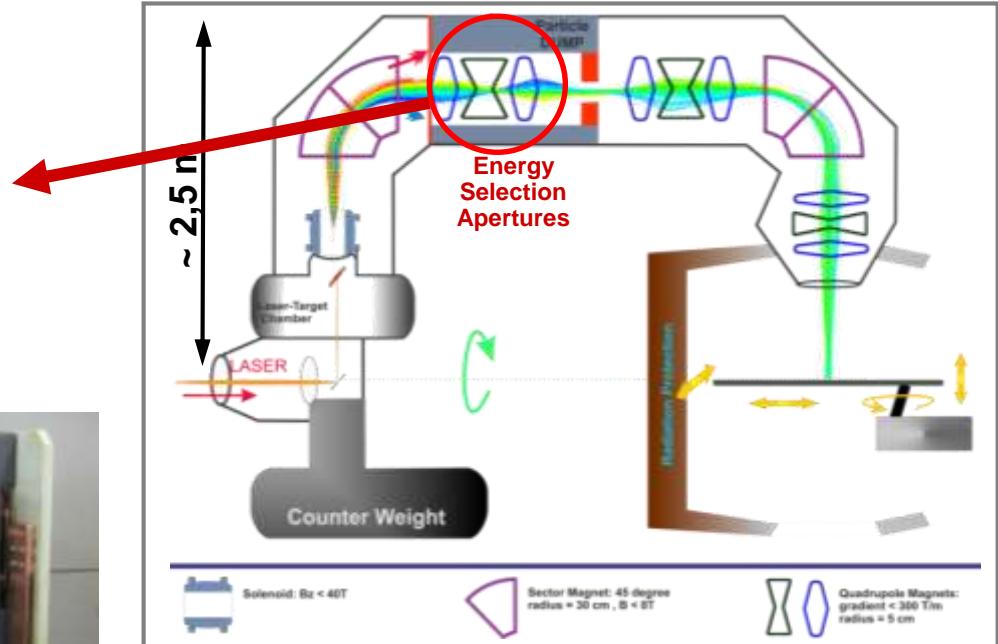

Winding design

Prototype

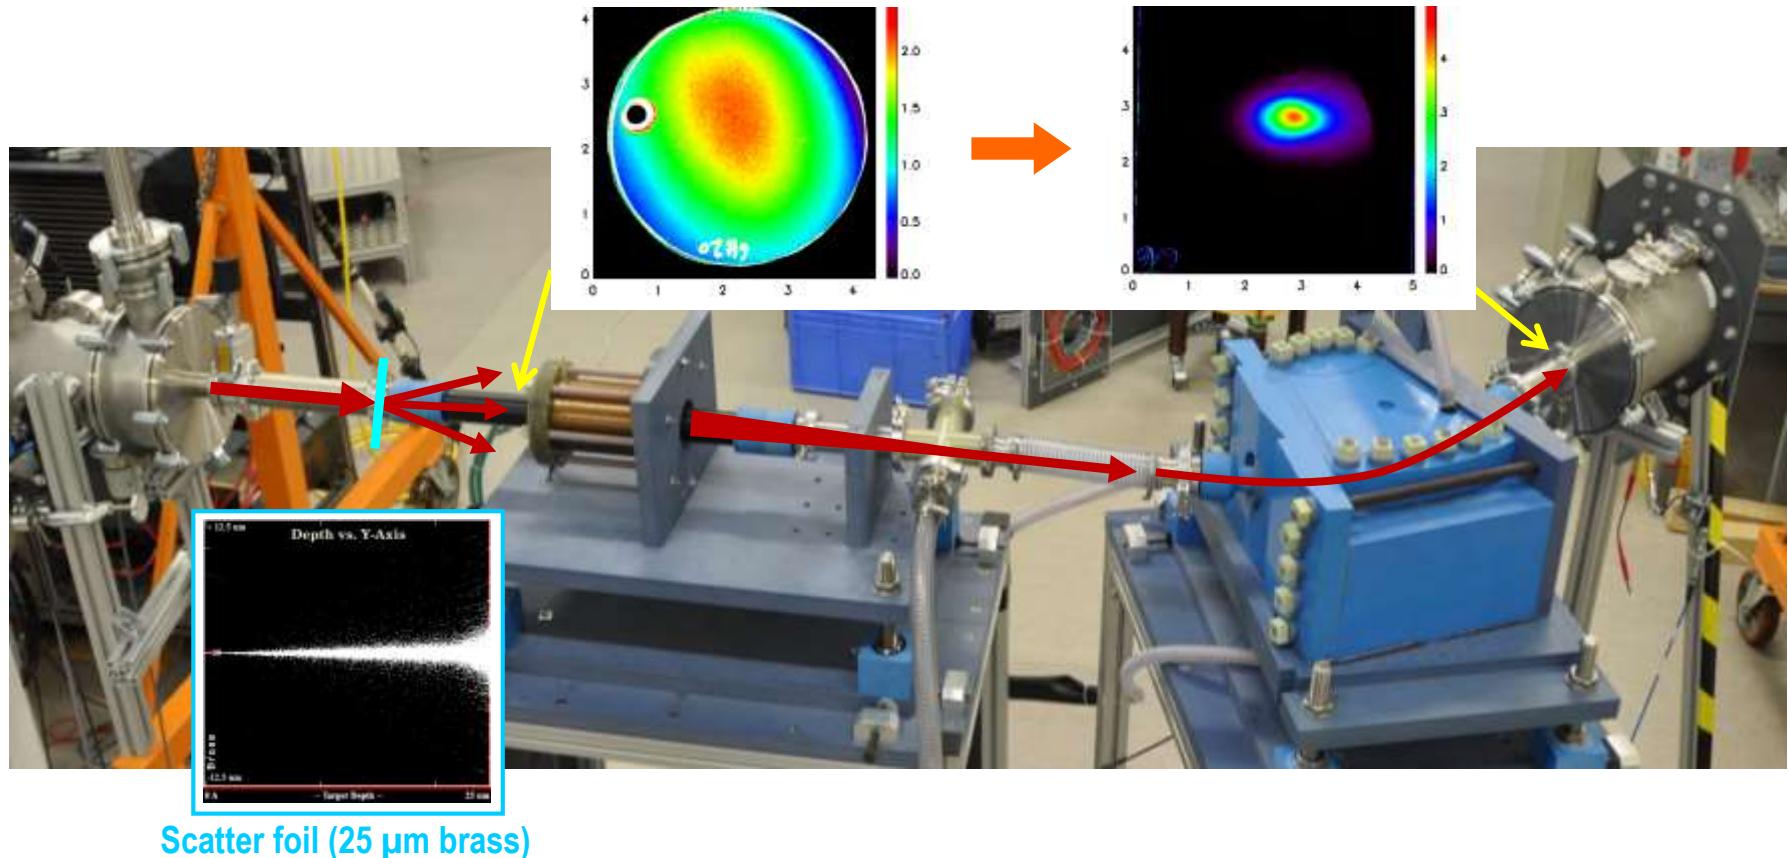

3D magnetic field simulation

5. Towards preclinical prototype

Pulse magnet beamline section:

- Tested at conventional pulsed proton beam (tandem, 10 MeV)

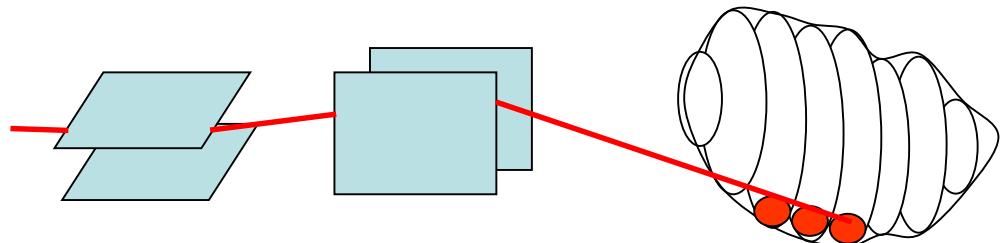

5. Towards preclinical prototype

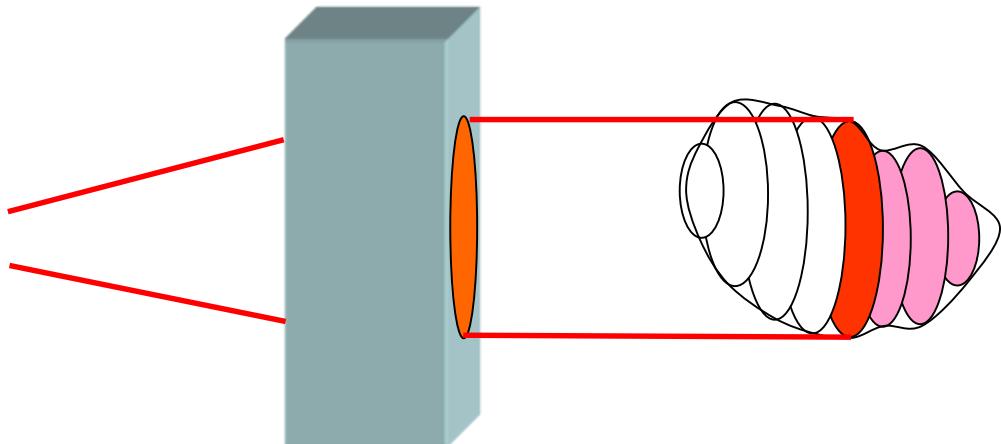

Dose delivery to large tumor volumes:

- Tumor conform dose delivery:
 - Dosimetric quality of treatment plans

1. Approach
Pencil beam +
defined **broad energy** spectrum

2. Approach
Wide beam +
quasi-monoenergetic

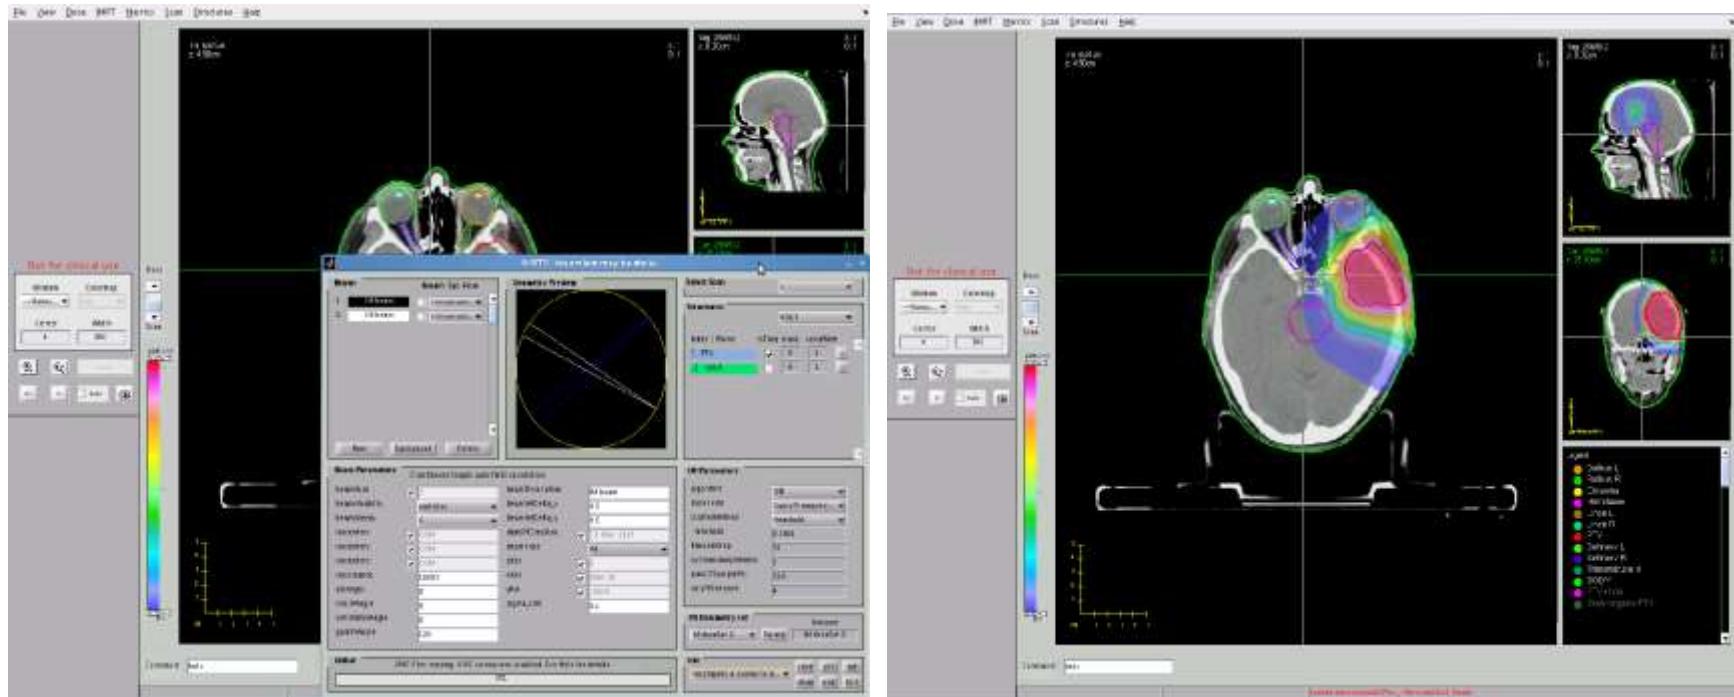

5. Towards preclinical prototype

Dose delivery to large tumor volumes:

- Treatment planning in collaboration with Prof. J. Wilkens
- Application of 3D TPS - CERR-LAP with our Gantry

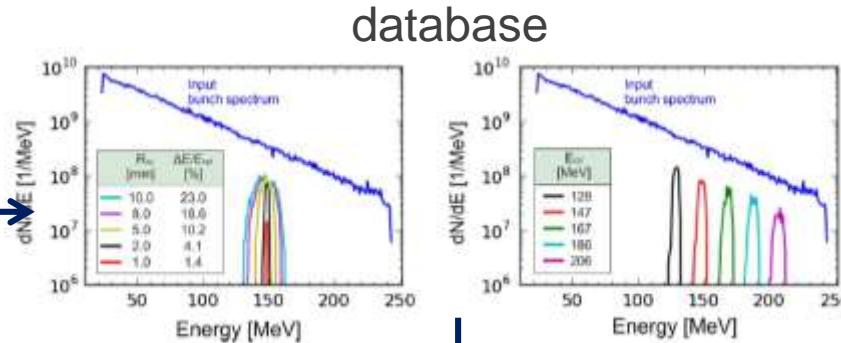

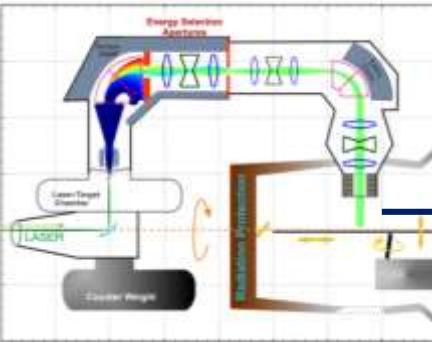

Technical University Munich

K. M. Hofmann, U. Masood, J. Pawelke, J. J. Wilkens, AAPM & DGMP Conference 2014

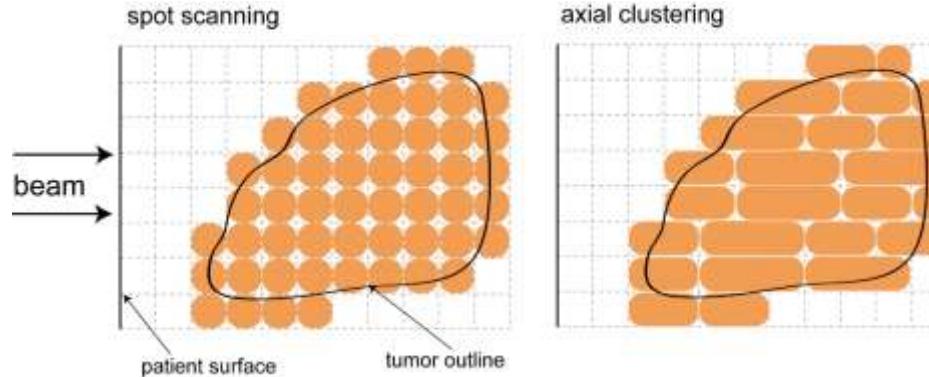

5. Towards preclinical prototype

Technical University Munich

Treatment Planning System (TPS)

- a) Vary lateral width of beam
- b) Vary proton number in input spectrum

1. Only integer shots possible
2. Modulate proton intensity from shot-to-shot

Multiple 3D proton plans

- Clinically interesting plans
- Plans which need detailed review
- Not acceptable plans

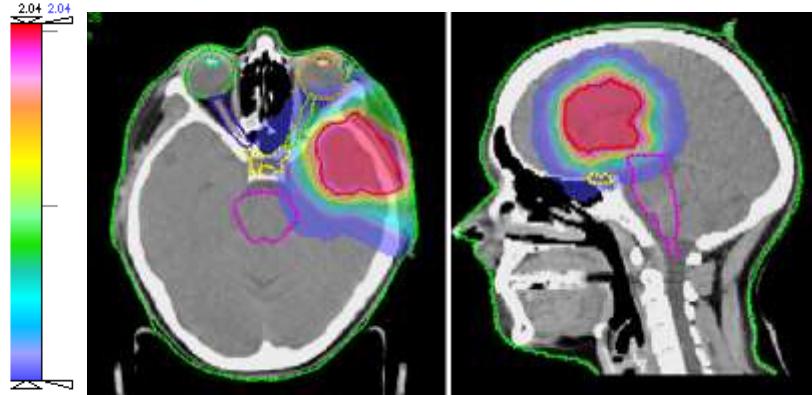

* S Schell, JJ Wilkens: Med Phys 37 (2010) 5330

5. Towards preclinical prototype

Dose delivery to large tumor volumes:

- Hundreds of treatment plans varying beam spot size, proton number and intensity modulation in input spectrum
- Treatment plans of high clinical quality

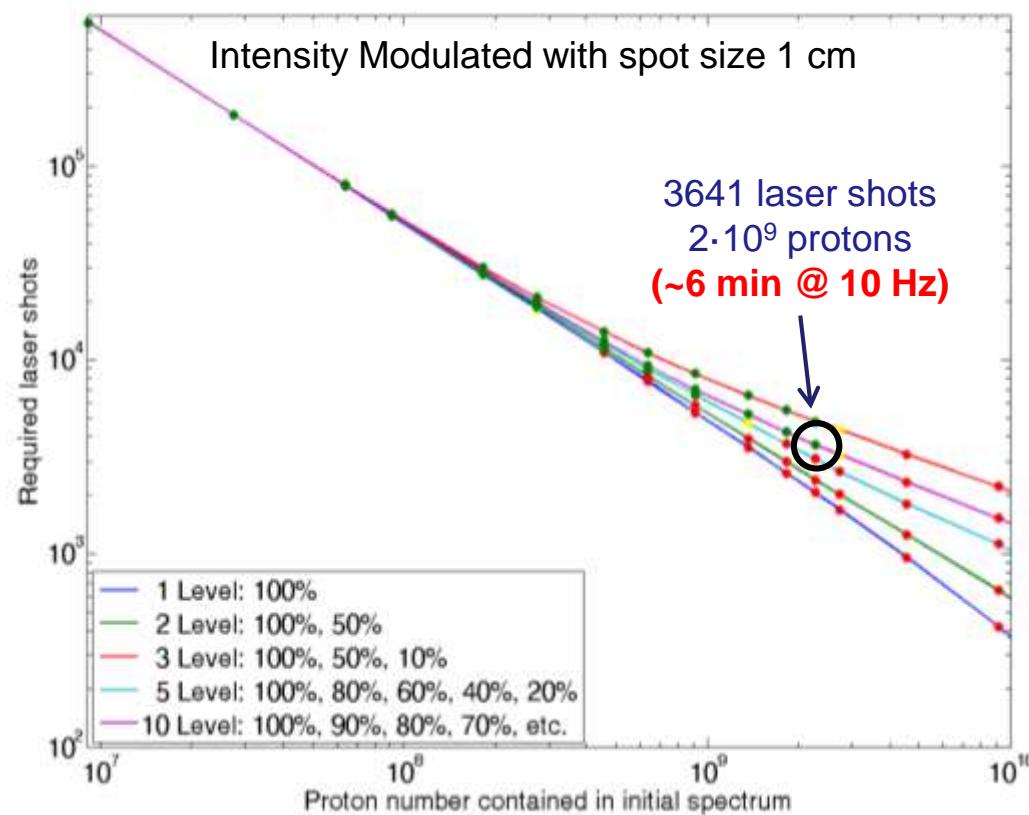

Astrocytoma, $V_{PTV} = 274 \text{ cm}^3$, Gantry: 50°/120°

Hofmann et al.: Med Phys 42 (2015) 5120

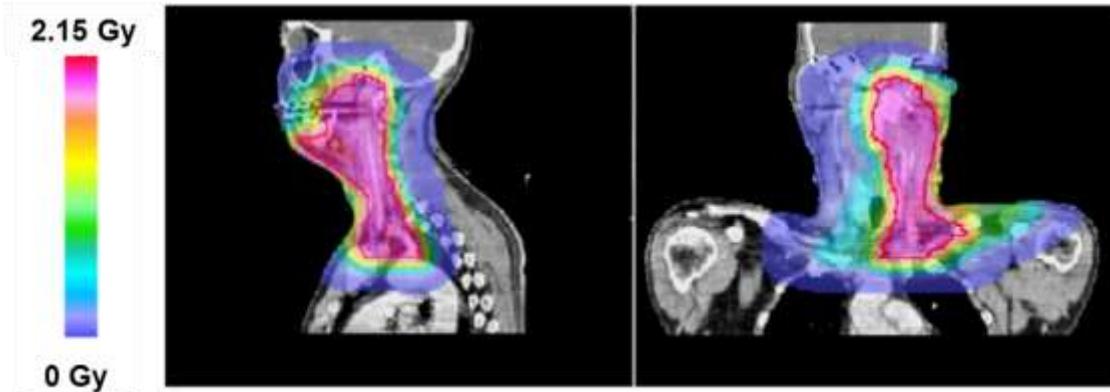

Masood et al.: Phys Med Biol 62 (2017) 5531

Technical University Munich

5. Towards preclinical prototype

Technical University Munich

Treatment planning evaluation:

Tumour volume	600 cm ³
Beam directions	50° and 300°
Beam spot size	2 cm (FWHM)
Energy widths	3 – 19%
Proton bunches	12326
No. of protons/bunch	3.75×10^6
Irradiation time (@ 10 Hz)	8 – 10 min <i>But: 5x conventional times!</i>

Hofmann et al.: Med Phys 42 (2015) 5120 & Masood et al.: Phys Med Biol 62 (2017) 5531

5. Towards preclinical prototype

University Proton Therapy Dresden:

History

- Layout conclusions: 2007
- Financing: 2009
- Start construction: May 2011
- Roofing ceremony: May 2012
- Inauguration: Sep. 2013
- 1st patient: Dec. 2014
- 1st experiment: Feb. 2015

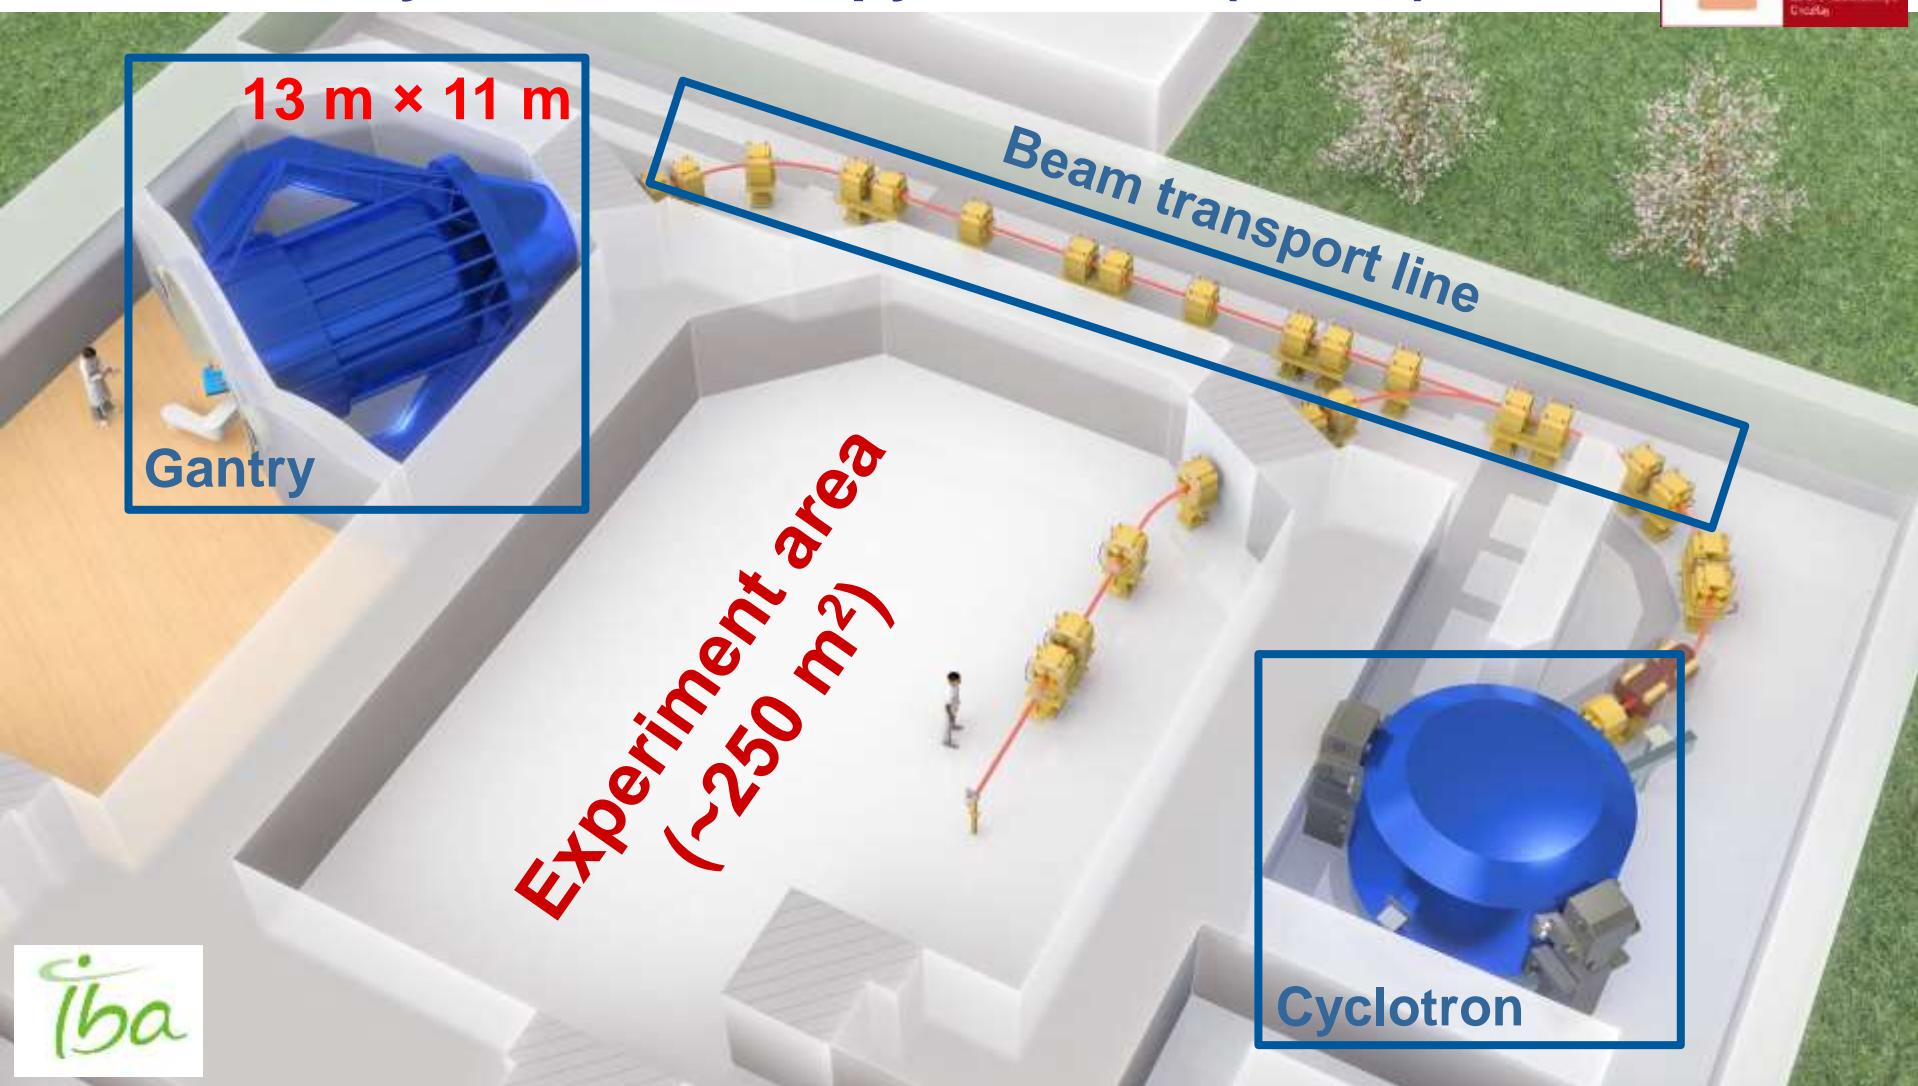

Present

- Increase number of patients (aiming for >270 patients in 2019)
- Experiments in parallel to patient treatment

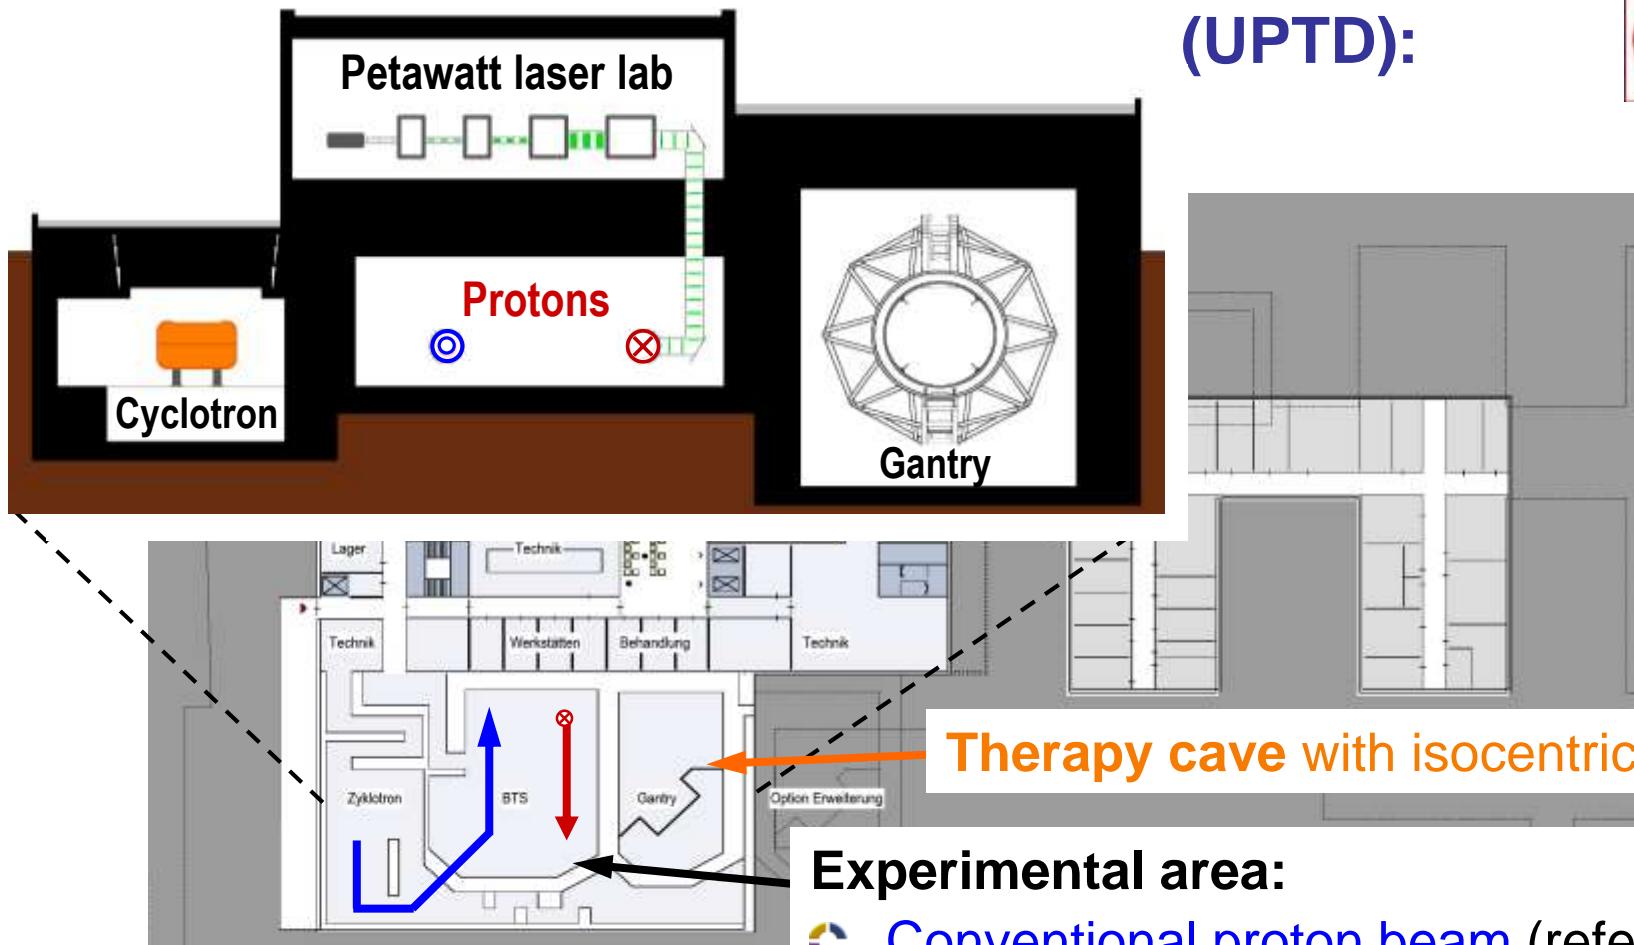

5. Towards preclinical prototype

University Proton Therapy Dresden (UPTD):

5. Towards preclinical prototype

Experimental area:

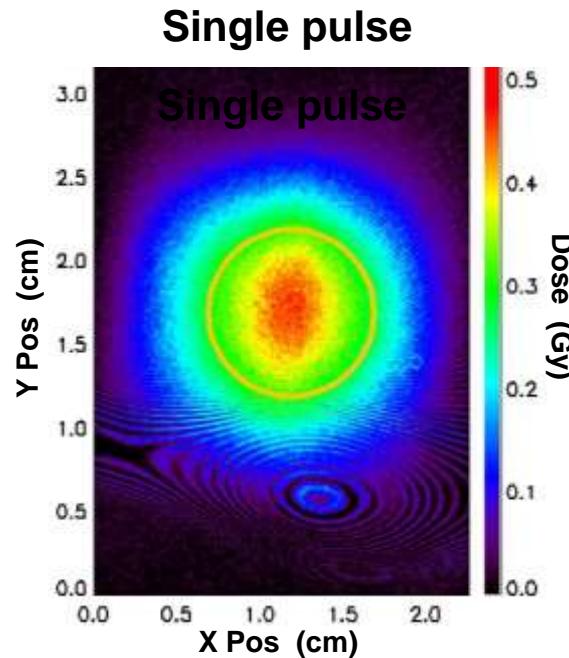

- Conventional proton beam (reference)
- Laser-driven protons (prototype system)

⇒ **Integrating prototype laser accelerator into clinical setting**

5. Towards preclinical prototype

Experimental area:

- ◉ Conventional proton beam
 - Horizontal
 - Monochromatic
 - $d = 10 \text{ mm (FWHM)}$
 - $E = (70 - 230) \text{ MeV}$
 - $I = (0.1 - 10) \text{ nA}$
- ◉ Flexible beam pulsing
 - $T, \Delta t = 100 \text{ ms} \dots \text{min}$
 - DPP = mGy ... Gy
- ◉ Pulse magnet tests

Summary

Laser-based irradiation technology is established for cell and small animal irradiation with electrons and protons.

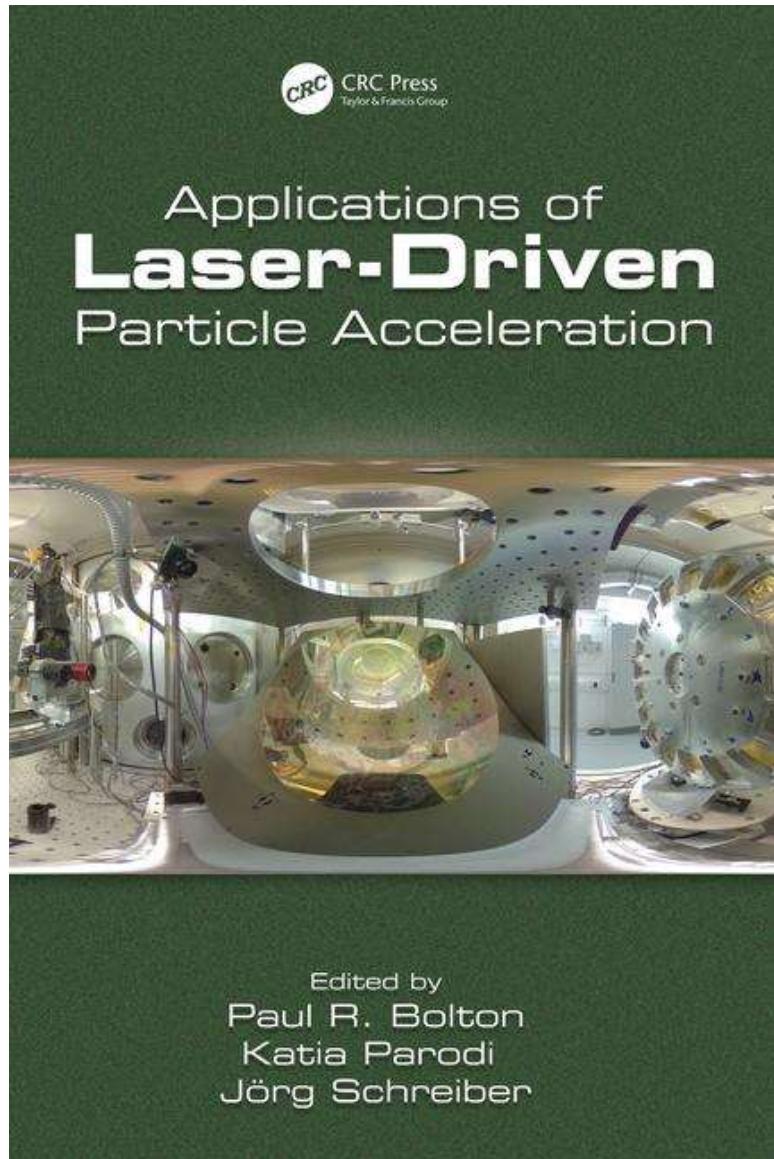

Medical proton beam units require new approaches for efficient and tumor conform irradiation of large target volumes by a rotating gantry.

Laser system and acceleration process improvement are crucial for providing therapy relevant proton beams (increase of proton energy, pulse repetition rate, stability, reproducibility, ...).

Development of a preclinical prototype still needs a lot of research and will take years!
